## EXECUTIVE SUMMARY

Montefiore St. Luke's Cornwall (MSLC) is located in Orange County, New York with main campuses in Cornwall (12518) and Newburgh (12550), along with several outpatient facilities including locations in Fishkill, NY (12524). MSLC is a member of the Montefiore Health System and provides care to more than 250,000 patients annually. MSLC is a 242 -bed acute care hospital, with a geographic coverage area that serves a population of 400,000 people. As a result of its location in the heart of the City of Newburgh, MSLC serves a patient base residing in what is designated as a Medically Underserved Area, deeming the hospital a Vital Access and Safety Net Provider.

The Montefiore St. Luke's Cornwall 2022-2024 Community Health Needs Assessment has been compiled utilizing data that derived from the 2022-2024 Mid-Hudson Region Community Health Assessment and the 2022-2024 Orange County Community Health Assessment. Furthermore, the Orange County Department of Health deployed the Community Asset Survey (CAS) in which residents of Orange County were asked to indicate the greatest strengths of the community and to identify where community efforts should be focused to improve quality of life, and lastly, what the most important health issues are. MSLC participated in the Orange County Community Health Summit on June 28,2022 , which included 100 community partners, specifically hospitals and health care providers, community-based organizations, and members of academia. These groups came together to review the most current Community Health Assessment data; identify and discuss the forces that impact the health of the residents; provide input on which two Prevention Agenda Priorities for the 2022-2024 CHIP should be chosen; and to participate in breakout groups to discuss current efforts, assets, and barriers in each of the five priority areas.

Going forward, MSLC, along with our hospital and community partners in Orange County, the local health department and other summit participants in each priority area will work collaboratively on the necessary ongoing strategic planning and implementation. All efforts of each group will be co-led by the Orange County Department of Health. The groups will report on a quarterly basis and at large, the annual health summit.

The above-mentioned sources were MSLC's Primary Data Collection Sources.

## The Orange County Community Health Needs Assessment identified the top 5 leading causes of death in the county include:

1. Heart Disease
2. Cancer
3. Unintentional Injury
4. Chronic Lower Respiratory Disease (CLRD)
5. Alzheimer's Disease

## The Top Three issues that affect health in Orange County include:

1. Housing
2. Mental Health
3. Public Transportation

## The Top Three Barriers in Achieving Health in Orange County are:

1. Drug and Alcohol Abuse
2. Knowledge of Existing Resources
3. Health Literacy

As noted in the 2022-2024 Orange County Community Health Assessment, heart disease and cancer are the leading causes of death and of premature death (death before age 75) by a large margin. Obesity is among the leading contributors to these top causes of death, as well as diabetes, stroke, and hypertension, all of which can lead to premature death. According to 2016 BRFSS data, referenced in the OC assessment, nearly 70\% of adults in Orange County are either overweight or obese. Data from 2016-2018 show that 36.8\% of school-aged children and adolescents are overweight or obese. Throughout the course of the last ten years, the rates of obesity have continually grown, along with the subsequent morbidity of cardiovascular disease, prediabetes, and hypertension.

The Orange County Assessment also reveals that the incidence of Sexually Transmitted Infections are increasing in Orange County. According to the Orange County Department of Health, there has been a $75 \%$ increase in the average number of newly diagnosed HIV cases in Orange County from 17.2\% per year (2011-2015) to 26.3\% per year (2016-2018). Chlamydia rates amongst both males and females from 2014-2016 are higher in Orange County than rates in the Mid-Hudson Region and have steadily increased or remained the same from 2011-2013 to 2014-2016. Additionally, Orange County had its first fetal demise in 2019 from congenital syphilis in over 25 years.

Other health areas where Orange County is worse than New York State or getting worse since the last assessment include:

- Overdose deaths due to opioid and heroin use
- Premature births among non-Hispanic Black women and Hispanic women
- Preventable adult hospitalizations
- Youth-reported alcohol and electronic vaping product use
- Unintended pregnancy among non-Hispanic Black women and Hispanic women
- Adults receiving colorectal cancer screening
- Cancer mortality including all cancer, female breast cancer, and color and rectum cancer
- Childhood immunization rates among children 24-35 months of age
- Unemployment rate
- Overdose deaths involving any opioid
- Gross rent as a percentage of household income: occupied units paying rent $30 \%$ or more

The 2022-2024 Orange County Community Health Assessment concluded the Emerging Issues are:

- Food insecurity
- Residents struggling with mental health
- Outbreaks of vaccine preventable diseases and emerging infectious diseases
- Affordable housing

These emerging issues will be a primary focus of both the Montefiore St. Luke's Cornwall and Orange County Community Service Plans and will be factored into our collaborative efforts to address the community health needs of the populations we serve. As a result of the above data points, MSLC has selected the following:

## The Two Prevention Agenda Priorities Selected for the MSLC 2022-2024 Community Service Plan:

- Prevent Chronic Disease
- Promote Well-Being and Prevent Mental Health and Substance Use Disorders

Date Report is Made Available to the Public: The 2022 Community Health Assessment will be submitted on December 30, 2022, and will be posted on the hospital's website.
www.Montefioreslc.org/community/

## The Montefiore St. Luke's Cornwall Board of Trustees approved this document on November 30, 2022. The Board of Trustees is MSLC's Governing Board.

## Hospital Description:

Montefiore St. Luke's Cornwall (MSLC) is located in Orange County, New York with main campuses in Cornwall (12518) and Newburgh (12550), along with several outpatient facilities including locations in Fishkill, NY (12524). MSLC is a member of the Montefiore Health System and provides care to more than 250,000 patients annually. MSLC is a 242 -bed acute care hospital, with a geographic coverage area that serves a population of 400,000 people. As a result of its location in the heart of the City of Newburgh, MSLC serves a patient base residing in what is designated as a Medically Underserved Area, deeming the hospital a Vital Access and Safety Net Provider.

MSLC's Newburgh campus is inclusive of the Main Inpatient Hospital and is located in the heart of the City of Newburgh which includes a Level III Trauma Center, Level II Neonatal Intensive Care Unit, Cardiac Catheterization Unit and Interventional Radiology, Birthing Center, Level II Neonatal Intensive Care Unit along with general medical/surgical units.

As referenced in table below, the MSLC Emergency Department treated just over 44,000 patients in 2021. Prior to the COVID-19 pandemic, the Emergency Department treated over 47,000 patients annually and MSLC has seen a slow but consistent increase back to previous volume.

The Cornwall Campus is an entirely outpatient facility providing Radiation Oncology, Rehabilitative Medicine, Pain Management, Wound Care, Imaging, and Sleep Medicine. Additionally, the Medical Group at Montefiore St. Luke's Cornwall is a hospital employed Primary and Specialty Care Group serving the medical needs of our community. This practice is certified as a patient centered medical home with a direct focus on the continuum of care required to keep those residing in MSLC's Primary and Secondary Service Area, healthy.

## Mission and Vision

Montefiore St. Luke's Cornwall's Mission is to provide exceptional health care to improve the lives and well-being of the people in the communities we serve. We aim to continue to serve as a leader in exceptional health care delivery by collaborating with our patients, providers, employees, and regional partners to improve the health of our community for life.

## Description of the Community and Population Served

Montefiore St. Luke's Cornwall is located in the Hudson Valley, with both main campuses located within Orange County. MSLC's patient population is divided amongst its Primary and Secondary Service Areas, which represent the zip codes in which $80 \%$ of the hospitals discharged patients reside.

MSLC's Primary Service Area (PSA) accounts for $60 \%$ of the discharged patients and the organizations Secondary Service Area (SSA) represents the remaining $20 \%$. As shown in the Table 1, there are three zip codes within MSLC's PSA which include Newburgh, New Windsor, and Beacon, and the nine zip codes in our SSA- inclusive of Wallkill, Cornwall, Cornwall-on-Hudson, and Monroe, amongst others.

As noted in the 2022-2024 Orange County Community Health Assessment, Orange County is located approximately 40 miles north of New York City. The following demographic summary is extracted directly from the 2022-2024 Orange County Health Assessment. The County is positioned between the Hudson River in the east and the Delaware River in the west, the only county in New York State to border both rivers. Ulster and Sullivan Counties border Orange County on the north, and Rockland County is located to the south. The states of New Jersey and Pennsylvania are located on the southwest borders of the County. Orange County is 839 square miles and is a diverse mix of rural farmland, suburban, and urban areas. Orange County communities include three cities, 20 towns, and 19 villages. Nearly $18 \%$ of the County's total population resides in its three cities of Middletown, Newburgh, and Port Jervis. Orange County has 19 public school districts and is the home to three colleges and universities. See Figure 1.

## HEALTH NEEDS ASSESSMENT PROCESS

## Overview:

The data in this section includes the information collected throughout Montefiore St. Luke's Cornwall's collaborative efforts with the Orange County Department of Health and our community partners. Much like the process in 2019, MSLC once again participated in the Mid-Hudson Region Community Health Survey, which is described in the Orange County Community Needs Assessment 2022-2024 as a service provider survey and subsequent focus groups were conducted in May and June 2022, in partnership with the Joint Membership of Health and Community Agencies (JMHCA) and Changing the Addition Treatment Ecosystem to collect data on underrepresented populations, including low-income, veterans, persons experiencing homelessness, the aging population, LGBTQ community, and those with a mental health diagnosis or those with a substance use disorder. A total of forty-five responses were collected and the following three underlying issues were identified as impacting the health of the populations served by their agencies:

1. Access to Affordable, Decent and Safe Housing
2. Access to Mental Health Providers
3. Access to affordable, Reliable Public and Personal Transportation

Additionally, the Orange County Department of Health (OCDOH) participated in the Mid-Hudson Region Community Health Survey, in partnership with the six other Mid-Hudson Region local health departments and the Siena College Research Institute to collect data on 996 residents to help better characterize the needs of the community. Key data points include the following:

- $43 \%$ of respondents with $<\$ 25 \mathrm{~K}$ yearly income reported that their ability to afford housing worsened over the course of the COVID-19 pandemic, compared to $23 \%$ of Orange County respondents.
- $37 \%$ of renters in Orange County reported that their ability to obtain affordable, nutritious food worsened over the course of the COVID-19 pandemic, compared to only $20 \%$ of homeowners.
- $33 \%$ of respondents with $<\$ 25 \mathrm{~K}$ yearly income reported being unable to access the internet in the past 12 months, compared to $17 \%$ of Orange County respondents.
- $32 \%$ of respondents with <\$25K yearly income were unable to get transportation when needed in the previous 12 months, compared to only $17 \%$ of Orange County respondents.
- $31 \%$ of Orange County respondents aged 18-34 reported that their mental health has worsened over the course of the COVID-19 pandemic, compared to only $12 \%$ of those aged 55 and older.
- $41 \%$ of Orange County respondents in 2022 reported there are sufficient, quality mental health providers, which is a decrease from the $55 \%$ reported in 2018.
- Only 59\% of Orange County respondents aged 18-34 reported having good or excellent mental health, compared to $75 \%$ of Orange County respondents and $85 \%$ of respondents aged $55+$.
- $33 \%$ of Orange County respondents with < $\$ 25 \mathrm{~K}$ yearly income reported that in the past 12 months, they or any other member of their household has been unable to get any healthcare including dental or vision compared to $21 \%$ of total Orange County respondents, and $9 \%$ of respondents with a $\$ 150 \mathrm{k}+$ yearly income.
- $26 \%$ of Orange County respondents aged $18-34$ reported that in the past 12 months, they did not visit primary care physician because they did not have insurance compared to $11 \%$ of respondents aged $55+$.

This data was shared with hospital participants, including MSLC, to help drive the process forward in our Community Needs Assessment review.

## Engaging the Community in the Assessment Process:

Furthermore, MSLC participated in the Community Asset Survey (CAS), which was developed and implemented by the Orange County Department of Health. MSLC helped to promote this survey to community residents in our Primary and Secondary Service area at community events, such as the Newburgh Illuminated Festival, which attracted more than 10,000 residents of our surrounding community. MSLC also shared this on social media and amongst our employees when feasible. MSLC communicated this to the thousands of members in the Orange County Chamber of Commerce Database via eblast in the month of June.

According to the Orange County Department of Health, the CAS was developed to ask residents to identify the greatest strengths of the community are, where should community efforts be focused to improve quality of life, and what the most important health issues are.

The CAS resulted in 928 residents responding. The three areas identified to direct resources and attention to improve quality of life were the following:

1. More Affordable Housing
2. Better Jobs and Economy
3. Improving Public Transportation

The CAS also revealed that the three prominent health issues according to respondents were the following:

1. Drug Use
2. Mental Health, Specifically Depression and Anxiety
3. Aging Problems such as Alzheimer's disease, Arthritis, Hearing/Vision Loss, etc.

Throughout the survey, respondents were asked which health priorities the community should select for the upcoming Community Health Improvement Plan for 2022-2024. More than 1,500 individuals responded and the top two priority areas voted on were the following:

1. Promote Well-Being and Preventing Mental Health and Substance Use
2. Promoting Healthy Women, Infants and Children

Following the CAS, the Orange County Department of Health provided a Community Health Assessment Data Review Guide, which included an analysis of more than 150 of the most up to date secondary data indicators available, which were then stratified by the New York State Department of Health Prevention Agenda Areas for both Orange County and New York State. This review guide included trends from prior years along with comparative data from New York State.

MSLC then attended the Orange County Health Summit, held on June 28, 2022, with 100 other community partners which included other area hospitals, health care providers, community organizations and members of the academia realm. Collectively, members of our community health planning and clinical teams, reviewed collaboratively the most recent Community Health Assessment data and with the result of a collaborative discussion, we identified and discussed the topics that most relevantly impact the health of the residents we collectively serve to decide on which two Prevention Agenda Priorities would be selected for the 2022-2024 Community Health Improvement Plan and MSLC's Community Service Plan. As a result of such collaboration, the following two areas were selected:

1. Preventing Chronic Disease
2. Promoting Well-Being and Preventing Mental Health and Substance Use

## Community Partners Consulted in the Process:

Montefiore St. Luke's Cornwall is proud to work collaboratively with our local health department (Orange County Department of Health), which has been a guiding force in the Community Needs Assessment Process. Additionally, MSLC has received continuous guidance from Montefiore Health System through our partnership and as a member hospital of the System.

The Community Based Organizations and partners involved in this collective process (all of which have been led by the Orange County Department of Health) outlined above include the following: Access: Supports for Living, Action Towards Independence, ADAC of Orange County, Affinity by Molina, Alzheimer's Association, American Cancer Society, Bon Secours, Catholic Charities, CCCSOS, CCR\&R, CDC Foundation, Children's Health Home of Upstate New York, CohnReznick, Community Service, Cornell Cooperative Extension, Cornerstone Family Healthcare, Department of Family Assistance, DFA, Division of Environmental Health (OCDOH), Esopus Medical, Ezra Choilim Health Center, Garnet Health, Hudson River Healthcare, Hudson Valley, Independent Living, Jewish Family Services of Orange County, KACH, MAA, Medicaid, MHA, MiSN CAPP Program, Montefiore St. Luke's Cornwall, NYSDOH, OC Legislature, OC Youth Bureau, Office for the Aging (Orange County Government), Orange County Department of Health (OCDOH), Orange County Department of Mental Health, Orange County District Attorney, Orange County Government Executives Office, Orange County Grants Department, Orange County Youth Bureau, Oxford House Inc., Planned Parenthood of Greater New York, Div. Community Engineer, PPGNY, RCLS, RCWATC, Resource Recovery Center of Orange County, St. Anthony Community Hospital, Sun River Health, The Emerald Peek Rehabilitation and Nursing, Tri-County Community Partnership, United Healthcare, USMS.

MSLC maintains strong partnerships for community education and engagement which are an essential piece of this process. These include the following: Orange County Chamber of Commerce, The Newburgh Armory Unity Center, the Newburgh Enlarged City School District, SUNY Orange, Mount Saint Mary College, The Newburgh Free Library, Fearless! Hudson Valley, Safe Harbors of the Hudson, The Cornwall Public Library, The Moffat Library of Washingtonville, Newburgh Rotary Club.

MSLC and other summit participants will now work together in each priority area, as part of the ongoing strategic planning and implementation processes. Each focus area has an identified work group that is led in partnership with the Orange County Department of Health and hospital staff throughout Orange County. These work groups will meet on a quarterly basis to report data and summary findings will be discussed at the annual Health Summit in late June to best drive our efforts moving forward.

MSLC has taken the data derived from both the Mid-Hudson Region Assessment, the Orange County Community Health Assessment, and the Community Asset Survey, and further compared it with the organizations specific discharge data for 2019, 2020, 2021, and 2022 Year to Date. As a result of our findings, MSLC has begun discussions with community and faithbased leaders to reach those facing significant health inequities, leading to poor health outcomes. A primary strategy of MSLC's Community Engagement Strategy for 2023 will include targeted educational presentations and screenings to our populations in need. The findings of such datapoints are outlined below.

## Prioritized Health Needs to Be Addressed:

The Community Health Needs Assessment process identified the following:
The top 5 leading causes of death in Orange County:

1. Heart Disease
2. Cancer
3. Unintentional Injury
4. Chronic Lower Respiratory Disease (CLRD)
5. Alzheimer's Disease

According to the 2022-2024 Orange County Community Health Assessment, morbidity measures illness and is defined in terms of incidence or prevalence. Incidence is the number of new cases of a disease divided by the number of people at risk for the disease. Prevalence is the total number of cases of disease existing in a population during a specific period of time. Mortality is another term for death. A mortality rate is the number of deaths due to a disease divided by the total population. Table 9 lists the top five causes of mortality in Orange County, as well as New York State and New York State excluding New York City. In 2019, the leading cause of death in both Orange County and New York State was heart disease. The second leading cause of death in Orange County was Cancer, followed by unintentional injury, Chronic Lower Respiratory Disease (CLRD), and Alzheimer's Disease. When looking within specific age groups, the leading causes of death differ. For example, accidents are the leading cause of death for those aged <45, whereas malignant neoplasms and diseasesof the heart take over as the leading cause for those 45 and older. Cause of death also differs by gender. For example, deaths from accidents and heart disease are consistently more common among males than females, and malignant neoplasms are more common amongst females. See Table 10 and Table 11 for a breakdown of the leading causes of death ranked within age groups by gender.

## All-Cause Mortality

When considering all causes of death, Orange County had an average crude mortality rate of 723.2 per 100,000 population from 2016-2019 and an age-adjusted rate of 680.5 from 2017-2019. When adjusting for age, the all-cause mortality rate in Orange County exceeds that of NYS exclude New York City. Unsurprisingly, the all-cause mortality rate is the highest for those aged $85+$. The rate for most age groups has not changed much over time, but for those aged $75-84$, the rate has slightly increased and for those aged 65-74, slightly decreased. When stratifying by race/ethnicity the crude all-cause mortality rate is consistently highest for the non-Hispanic White population and lowest for the Hispanic and "Other" populations. However, when adjusting for age, the non-Hispanic Black population faces the highest mortality rate, and the Asian/Pacific Islander population has the lowest. Those who live in the 12771-zip code suffer the highest all-cause mortality rates in the county, followed by those who live in 10940. Zip code 10950 has the lowest all-cause mortality rate. This trend has remained consistent over time [See Table 12, Figure 5, Figure 6].

## Premature Death

The percentage of premature deaths for those younger than 75 years of age in Orange County is $43.6 \%$, slightly higher than the total New York State rate of $40.8 \%$. When stratifying across race/ethnicity, non-Hispanic Black populations face the largest percentage of premature deaths, followed by Asian/Pacific Islander and Hispanic populations [see Figure 7].

Figure 7

Source: NYSDOH County Health Indicators by Race/Ethnicity (CHIRE), Updated as of March 2022
https://www.health.ny.gov/statistics/community/minority/county/orange.htm

## Economic Stability

Employment

Occupation and employment affect health through many avenues. Those who are continuously employed tend to have better health outcomes in both mental and physical health conditions than those who are unemployed. Even within employed populations, there can be disparities between those with high-paying and low-paying jobs. Income can affect where a family is able to live, the kind of food they eat, insurance coverage and almost every other social determinant of health. Unemployment rates in Orange County saw an overall decrease from 2011 to 2019, dropping from 8.0\% to 3.8\%. From 2019 to 2020, the percentage of the labor force unemployed increased dramatically up to $8.4 \%$, the highest it has been in the 9 -year span. The percentage of the labor force unemployed in NY State exclude New York City has followed the same trend over time [see Figure 8].

Figure 8

Note: Single-year estimates for both Orange County and NYS excl. NYC are graphed above.

Original Data Source: United States Department of Labor, Updated as of July 2021

## Poverty

The U.S. Census Bureau defines a family, and every individual in it, as being in poverty when their income is less than the family's threshold. See Table 13 for the defined thresholds, which do not vary geographically.

Table 13

Source: U.S. Census Bureau, Updated as of May 2022
https://www.census.gov/data/tables/time-series/demo/income-poverty/historical-poverty-thresholds.htm/
Poverty and health are closely linked, with those in poverty often shown to have an increased risk of chronic and mental health conditions, mortality, and lower life expectancies.

## "New York State Community Action Association's Annual Poverty Report (2019) breaks down poverty rates and statistics by each

 county. "Over 11\% (11.4\%) of people in Orange County during 2020 had poverty status, which is slightly lower than New York State and national rates. There were disparities in poverty between racial/ethnic groups in the county. Native Hawaiian/Other Pacific Islander populations faced the highest rates of poverty, at $27.3 \%$. This group also has the highest rates of poverty in New York State ( $23.8 \%$ ). American Indian/Alaska Native populations had the lowest poverty rates in Orange County ( $6.7 \%$ ), much lower than the poverty status rate for American Indian/Alaskan Native populations statewide (22.6\%) and nationally ( $24.1 \%$ ). Family poverty status follows a similar trend. Native Hawaiian/Other Pacific Islander populations had the highest percentage of families with poverty status in Orange County, while American Indian/Alaska Native families had the lowest [see Figure 9, Figure 10].

Poverty rates have fluctuated in Orange County from 2010-2019. From 2011 - 2017, there was an overall decrease in poverty. However, these rates increased from 2017-2019 (see Figure 11). The percentage of children (aged <18 years) below poverty has followed the same trend. There was an overall decreasing trend until 2017, and since then the percentage or children below the poverty level has steadily increased (see Figure 12).

## Education

## High School Graduation

Obtaining a high school diploma is tied with higher lifetime earnings, as well as better health outcomes. Those who have dropped out of high school before graduating have an increased risk of premature death and are more likely to report at least one chronic health condition, and are more likely to be in poverty, when compared to those who have graduated.
In Orange County, the total high school graduation rate was $89.0 \%$ in 2021. This is slightly higher than the high school graduation rate in all of New York state, which is $86.0 \%$. Disparities in graduation rates exist between racial and ethnic groups. The Asian or Native Hawaiian/Other Pacific Islander population in Orange County had the highest high school graduation rate in 2021 ( $94.0 \%$ ), followed by the American Indian/Alaskan Native and non-Hispanic White populations, which both had a rate of $84.0 \%$. This trend was similar to that in NY state, except those American Indian/Alaska Native students had a much lower graduation rate at the state level ( $82.0 \%$ ) [see Figure 13].

## Health Care Access and Usage

Health Insurance Coverage
Insurance coverage is one of the largest factors affecting health care access. People without health insurance are less likely to access medical services than those who are insured. Having health insurance increases health care access and health monitoring which prevents entrance into the medical system when conditions have gotten more severe and expensive. Several government programs, such as Medicaid and the Children's Health Insurance Program help provide low and no-cost insurance to children who qualify. This helps lower the rates of uninsured children.
4.8\% of the civilian non-institutionalized population in Orange County is uninsured. This is lower than the percent of uninsured in both New York State and the U.S. ( $5.4 \%$ and $8.7 \%$, respectively). When stratifying by race/ethnicity, there are large inequities in insurance coverage in Orange County. Native Hawaiian/Other Pacific Islander populations have a strikingly higher percent of uninsured individuals (27.1\%) when compared to other races/ethnicities. This is also much higher than the percent of uninsured for the Native Hawaiian/Other Pacific Islander population at the NY State and national levels ( $9.3 \%$ and $10.8 \%$, respectively). Non-Hispanic White populations have the lowest percent of uninsured in Orange County, at $3.2 \%$ [see Figure 14].

## Neighborhood and Built Environment <br> Lead Poisoning

Lead affects every system of the body, and there is no safe blood lead level. Children are especially vulnerable to the negative impacts of lead exposure which can lead to slowed growth and development; damage to the brain and nervous system; behavioral problems; and hearing and speech problems.

Lead exposure can occur through air, food, water, and dust. Sources of lead can include gasoline, consumer products, and solder. For children, lead based paint is the most common source of lead exposure.

Certain groups of children are at a higher risk for lead exposure than others, often due to the types of housing they live in. These groups include children in low-income households, racial/ethnic minorities, recent immigrants, and those whose parents are exposed to lead through their work.

New York State requires health care providers to test all children for lead exposure at age one and again at age two. From 2010-2019, the incidence of confirmed high blood lead level ( 10 micrograms or higher per deciliter) in children younger than 72 months has fluctuated in both Orange County and New York State. The high blood level incidence levels in the county steadily decreased from 2014-2017, but since 2017 there has been a slight increase [see Figure 15].

Note: Three-year averages for Orange County and single-year estimates for NYS excl NYC are graphed above.

## Prevent Chronic Diseases

Chronic Lower Respiratory Diseases
Chronic Lower Respiratory Diseases (CLRD) is a classification of diseases that affect the lungs and the respiratory tract. Some diseases include emphysema, bronchitis, asthma, and other chronic obstructive pulmonary diseases (COPD). Symptoms of CLRD include airflow constriction, leading to difficulty breathing.

From 2017-2019, Orange County had a chronic lower respiratory disease hospitalization rate of 27.4 per 10,000 population. This is slightly higher than the New York State rate of 25.8 per 10,000. Disparities were identified when stratifying CLRD hospitalization rates by race/ethnicity. Non-Hispanic Black adults had the highest CLRD hospitalization rate in the county at 37.4 per 10,000. In contrast, Asian/Pacific Islander adults had a much lower CLRD hospitalization rate than any other racial/ ethnic group in the county at 5.8 per 10,000. These rates are consistent with the New York State trends [see Figure 16].

COPD/CLRD mortality in Orange County from 2016-2019 averaged at 37.7 deaths per 100,000 population, and consistently remained lower than that in NYS excluding New York City during this time. There were also disparities in mortality rates from COPD/CLRD, however the disparities differ from hospitalizations. The non-Hispanic White population faced a much higher death rate from COPD/CLRD compared to non-Hispanic Black and Hispanic populations, at 52.1 compared to 17.7 and 8.6, respectively. Females had a slightly higher risk of both being discharged for and dying from COPD/CLRD than males. When looking within zip codes, 12771 had a significantly higher rate of COPD/CLRD mortality compared to other zip codes, averaging at 83.0 deaths per 100,000 [see Table 15, Figure 17, Figure 18, Figure 19].

## Asthma

Asthma is caused by airway restriction in the lungs resulting in difficulty breathing, wheezing, chest tightness, and coughing. It is one of the most common diseases found among children, but the onset can also occur during adulthood. It can be caused by a variety of factors that may be genetic, environmental, or stress related. In many cases, people are unaware they have asthma and there is no definitive cure for the disease. However, there are ways to manage it with medical care by avoiding triggers, such as allergens, intense physical activity, tobacco smoke, and air pollution. It is important that intervention starts in early childhood to avoid increased medical costs and fatal consequences.

From the most recent data in 2017-2019, Orange County had an asthma hospitalization rate of 7.5 per 10,000 population. This is lower than the New York State rate of 10.3 per 10,000. There were large disparities in asthma hospitalizations across racial and ethnic groups in the county. Non-Hispanic Black adults by far had the highest rates of asthma hospitalizations, at 15.6 per 10,000 population. Though this was the highest rate in Orange County, it is lower than the rate for Non-Hispanic Black populations across New York State (21.5 per 10,000). Similarly, Hispanic adults had a much lower asthma hospitalization rate in Orange County compared to New York State (7.3 and 15.5 per 10,000, respectively) [see Figure 20].

Asthma discharge rates for adults (18+) decreased substantially in the County from 2014-2017, dropping from 15.7 per 10,000 in 2014 to 5.5 per 10,000 in 2017. New York State excluding New York City and the rest of the Mid-Hudson Region followed a similar trend [see Table 16, Figure 21]. Asthma discharge rates increase as age increases and is higher for males in the county compared to females. Asthma discharges also varied by race. Where known, the rate of discharges was highest for the nonHispanic Black population. Those in zip code 10940 also suffered the highest asthma discharge rates [see Table 16, Figure 22, Figure 23].

Figure 20

*. Fewer than 10 events in the numerator, therefore, the rate is unstable.

Where the asthma discharge rate for adults decreased in Orange County over time, that of children has increased, from a rate of 6.1 per 10,000 children aged 5-17 in 2016 to 8.7 in 2019. This is in contrast with the NYS excl. rate, which decreased from 2016 to 2019 [see Table 17, Figure 24]. Children aged 5-9 suffered the highest discharge rates, and the rate improved as the ages increased up to 17. The discharge rates for both males and females increased until 2016 , where the rate continued to increase for females but decreased slightly for males. When stratifying by race/ ethnicity, Black children suffered the highest average rate of asthma discharge from 2014-2017, where known [see Table 17, Figure 25, Figure 26, Figure 27]

Where the asthma discharge rate for adults decreased in Orange County over time, that of children has increased from a rate of 6.1 per 10,000 children aged $5-17$ in 2016 to 8.7 in 2019. This is in contrast with the New York State excluding rate, which decreased from 2016 to 2019 [see Table 17, Figure 24]. Children aged 5-9 suffered the highest discharge rates, and the rate improved as the ages increased up to 17. The discharge rates for both males and females increased until 2016, where the rate continued to increase for females but decreased slightly for males. When stratifying by race/ethnicity, Black children suffered the highest average rate of asthma discharge from 2014-2017, where known [see Table 17, Figure 25, Figure 26, Figure 27].

## Pneumonia

Pneumonia is an infection that causes inflammation in the air sacs in one or both lungs. Pneumonia can be caused by bacteria, viruses, or fungi. It can lead to serious consequences in young children, as well as people over the age of 65 . Symptoms of pneumonia include fever, cough, chest pain, and shortness of breath. Hospitalization, tobacco use, or having a weakened immune system can put people at a greater risk of developing pneumonia.

From 2016-2019, the average mortality from pneumonia in Orange County was 17.2 per 100,000 population, which is lower than the rate for New York State excluding New York City of 20.6. Pneumonia mortality decreased in the county from 20162018 but increased from 2018-2019 [see Table 18, Figure 28]. Pneumonia mortality risk increases with age, with those 85 and older suffering the highest death rate, at 410.7 per 100,000. The non-Hispanic White population is more likely to suffer pneumonia mortality compared to the non-Hispanic Black and Hispanic populations in the county. The three major cities in the county (zip code 10940, 12550, and 12771) have similar rates of pneumonia mortality and are much higher than the rate in 10950 [see Table 18, Figure 29, Figure 30].

## Cardiovascular Disease

Cardiovascular disease (CVD), or heart disease, is the leading cause of death in the U.S., killing more than 650,000 people each year. CVD refers to several conditions that affect the heart and other components of the circulatory system. It involves blocked or hardened blood vessels (otherwise known as atherosclerosis) that can lead to diseases, including (but not limited to) congestive heart failure, cerebrovascular disease or stroke, coronary artery disease, or a heart attack.

Some risk factors for CVD include genetics, age (as you get older, the risk for CVD becomes higher), unhealthy lifestyle behaviors (unhealthy diet, decreased physical activity, tobacco use, alcohol use), stress, and other health conditions (high blood pressure, high cholesterol, diabetes, and obesity).
Discharge rates for CVD in Orange County from 2014-2017 were lower than those in New York State excluding New York City but higher than those in the rest of the Mid-Hudson Region. In all of NYS, including Orange County, CVD discharge rates were higher among males than females [see Table 19].

The average CVD mortality rate in the county from 2016-2019 was 213.2 per 100,000, and the rate didn't fluctuate much in that time frame. The county rate was consistently lower than that of NYS excluding NYC from 2016-2019 [see Table 20, Figure 31]. There are disparities in CVD mortality by age, gender, race/ethnicity, and zip code. Those who are older and male face a higher risk of death from CVD. The non-Hispanic White population suffers a much higher CVD mortality rate compared to other races/ethnicities in the county, as well as those who live in zip code 12771 [see Table 20, Figure 32, Figure 33, Figure 34].

## Disease of the Heart

The average crude diseases of the heart mortality in Orange County from 2016-2019 was 169.9 per 100,000 population. Over time the mortality rate slightly decreased, from 183.7 in 2016 to 157.6 in 2019, and over that timespan, remained lower than the mortality rate in NYS excl. NYC [Table 20, Figure 35]. Deaths from diseases of the heart increase with age and are higher for males than females. There are also disparities in mortality by race/ethnicity. When adjusting for age, the non-Hispanic Black population had the highest diseases of the heart mortality rate of 176.9 per 100,000 and Asian/Pacific Islander populations had the lowest, at 64.2 per 100,000. CVD mortality also differs by zip code in the county, with those who live in 12771 suffering the highest rate among major cities in the county [see Table 21, Figure 36, Figure 37].

## Cerebrovascular Disease

Cerebrovascular disease, also called a stroke, occurs when blood supply to the brain is blocked, which can lead to extensive damage to the brain and even death. It is important to recognize the signs and symptoms of a stroke in order for action to be taken quickly. Signs of a stroke include numbness in the face or extremities, often on one side of the body; confusion or difficulty speaking; vision problems; loss of balance or lack of coordination; or a severe headache. Some risk factors for a stroke include lifestyle behaviors (unhealthy diet, decreased physical activity, use of illicit drugs) and other medical conditions, including high blood pressure, high cholesterol, diabetes, other types of cardiovascular diseases, family history, and being aged 55 years and older.

When adjusting for age, stroke hospitalizations in Orange County are slightly higher than that of NYS excluding NYC, and there are disparities in rates by race/ethnicity. When adjusting for age, non-Hispanic Black populations had higher rates of stroke hospitalization ( 27.9 per 10,000) compared to other racial/ethnic groups in the county.
Asian/Pacific Islander populations had the lowest rate of 13.4 per 10,000. Stroke hospitalization trends across race/ethnicity in Orange County are consistent with those at the state level [see Figure 38].

Mortality from strokes has averaged at 26.9 per 100,000 population in Orange County from 2016-2019, which is lower than the rate for NYS excluding NYC (37.8) [see Table 22, Figure 39]. The frequency of stroke mortality increases with age and is higher for males than females. Like stroke hospitalizations, there are also disparities in stroke mortality when stratifying by race/ethnicity. However, in this case the mortality rate is highest for the non-Hispanic White population (33.1) compared to the non-Hispanic Black (25.1), Hispanic (10.3), and "Other" (16.5) populations. Those who live in the zip code 12550 suffer a higher rate of stroke mortality compared to other zip codes in the county [see Table 22, Figure 40, Figure 41].

## Diabetes

In the U.S., diabetes is the seventh leading cause of death. It is a chronic condition that alters how the body breaks down glucose (sugar) for energy. Diabetes can be classified into two primary forms: insulin-dependent diabetes mellitus (type 1 diabetes) and non-insulin-dependent diabetes mellitus (type 2 diabetes). Type 1 diabetes occurs when the body attacks itself and does not make enough insulin, which is a hormone released from the pancreas to help break down glucose. Alternatively, type 2 diabetes occurs when the body is unable to use existing insulin to help control the amount of glucose released into the blood stream. According to the CDC, about 90\%-95\% of people with diabetes have type 2 diabetes.

Before people are diagnosed with diabetes, they are usually tested for prediabetes, which is when a person's blood sugar level is higher than normal, thereby putting them at a greater risk of developing diabetes. According to the NYSDOH, 15-30\% of the population in New York State with prediabetes will develop type 2 diabetes within five years, if they do not change their lifestyle behaviors.

From 2017-2019, the average diabetes hospitalization rate (age-adjusted) in Orange County was 16.8 per 10,000 population, which is lower than the NYS rate of 18.9 per 10,000. There were large disparities in diabetes hospitalization rates across race/ ethnicity. Non-Hispanic Black populations had the highest hospitalization rate at 28.8, and Asian/Pacific Islander had the lowest at 5.1 [see Figure 42]. There were also disparities in diabetes discharge rates by gender, with males having a much higher discharge rate than females [see Table 23].

Similarly, to diabetes hospitalizations, diabetes mortality was slightly lower in Orange County compared to NYS excluding NYC, with an average of 16.2 diabetes deaths per 100,000 compared to 17.6. While the mortality rate in NYS excluding NYC consistently increased from 2016-2019, that in Orange County has remained more stable over time [see Table 24, Figure 43]. The rate of diabetes mortality increases with age, and just as with diabetes hospitalizations, non-Hispanic Black populations faced the highest diabetes mortality rate in both the county and NYS excluding NYC when compared to other racial/ethnic groups [see Table 24, Figure 44].

## Cirrhosis of the Liver

Cirrhosis is a condition in which the liver experiences fibrosis (scarring) that can lead to permanent damage. In the U.S., it is included in the top ten leading causes of death. Causes of cirrhosis include (but are not limited to) chronic alcohol abuse, viral hepatitis (more commonly hepatitis B and C), and fatty liver disease. Symptoms also include fatigue, bleeding, edema (swelling) in lower extremities, and hepatic encephalopathy (loss of brain function due to the liver's inability to remove toxins from the blood).

From 2016-2019, mortality from cirrhosis of the liver averaged at 8.1 deaths per 100,000 population. Mortality rates increase with age and are higher among males and the non-Hispanic White population in the county [see Table 25, Figure 46]. Discharge rates for cirrhosis of the liver were also higher among males than females in the county, which follows the trend seen at the state level (excluding NYC) [see Table 26].

Age-adjusted cirrhosis mortality in Orange County started to decrease in 2013, but in 2015, it started increasing again, reaching a high of 7.5 per 100,000 in 2018. This increase beginning in 2015 is also seen at the state level, though the rates for Orange County have remained below those of the state over time [see Figure 45].

## Chronic Kidney Disease

Rates for Emergency Department visits relating to chronic kidney disease have increased in both Orange County and NYS (exclude NYC) since 2011. The rate for Orange County has consistently been higher than that of NYS over time. While Emergency Department visits had been increasing, chronic kidney disease hospitalization rate had been decreasing in the county from 2011-2013. However, the rates increased from 2017-2018. Similarly to Emergency Department visit rates, the hospitalization rate for chronic kidney disease in Orange County has remained higher than that of NYS (excluding NYC) over time [see Figure 47, Figure 48].

Figure 47

[^7]Figure 48

\#: The rate for 2015 is excluded due to SPARCS data transitioning on October 1, 2015 from ICD-9-CM to ICD-10-CM diagnosis codes. Due to this transition, data for 2016-and-forward should not be compared with data for 2014-and-prior.

## Cancer

Cancer is a disease in which the cells of the body grow out of control and invade tissues in the body. Cancer can metastasize, or spread, from one part of the body to another. These masses of cells that spread are called malignant neoplasms, or tumors. There are a variety of risk factors for cancer, including genetics, environment, and health behaviors. These include smoking, drinking alcohol, diet, and physical activity.

Cancer is one of the leading causes of death across all seven counties in the Mid-Hudson Region. From 2014-2018 Orange County had an average yearly cancer incidence rate (age-adjusted) of 496.2 per 100,000 population. This rate has remained relatively stable over time in both Orange County and NYS excluding NYC [see Figure 49]. When stratifying by race/ethnicity, the White non-Hispanic population in the county had the highest cancer incidence with a rate of 513.0 per 100,000. This number is slightly below the NYS incidence rate but well above the U.S. national rate. The Asian/Pacific Islander population has the lowest cancer incidence at 338.0 per 100,000 population [see Figure 50]. The discharge rate for malignant neoplasms (cancerous tumors) was much lower in Orange County than in the rest of the Mid-Hudson Region and NYS excluding NYC for both males and females from 2014-2017. Males in Orange County had a slightly higher rate than females, at 17.1 per 10,000 compared to 12.6. This contrasts the trend in the rest of the Mid-Hudson Region and NYS excluding NYC, where females tend to have higher malignant neoplasm discharge rates [see Table 27].

Rates are calculated using ACS 5-year population estimates
Source: 2014-2017 SPARCS Data
Created by the School of Public Health, University at Albany, 2021

From 2015-2019, the average age-adjusted mortality from malignant neoplasms (cancerous tumors) was 151.8 per 100,000 population. This is slightly lower than the overall U.S. rate, but higher than that of NYS excluding NYC [see Figure 53]. The rate of death from malignant neoplasms increases with age and is higher for those who live in zip code 12771 [see Table 28, Figure 52]. When stratifying by race/ethnicity, malignant neoplasm mortality (both crude and age-adjusted) is highest among non-Hispanic Whites in the county and lowest among Hispanic, Asian/Pacific Islander and "Other" racial/ethnic groups. This has consistently been the trend over time [see Table 28, Figure 51, Figure 53].

When looking at rates over time, all cancer mortality rate (age-adjusted) followed a steady trend similar to all cancer incidences until 2014, where mortality in the county began to markedly increase. This differs from NY State, where all cancer mortality continued to decrease over time [Figure 54].

[^9]
## Colorectal Cancer

Colorectal cancer is a cancer that occurs in the colon or rectum. Some symptoms include blood in the stool, abdominal pains or aches, fatigue, and abnormal weight loss. From 2016-2018, Orange County had an average colorectal cancer incidence rate of 40.0 per 100,000, which is slightly above the NYS rate. When looking over time, colorectal cancer incidence has slightly decreased in the county as well as in NYS [Figure 55, Figure 56].

There are stark disparities in colorectal cancer incidence by race/ethnicity in the county. The Non-Hispanic Black population had the highest rate at 57.9 per 100,000, compared to the non-Hispanic White, Hispanic, and Asian/Pacific Islander populations [see Figure 55].

Figure 55

Original Data Source: Cancer Registry Data, Updated as of 2020

Orange County has a colorectal cancer mortality rate of 17 per 100,000, higher than the NYS rate of 12.1. When looking over time, colon and rectum cancer mortality rates have decreased for NYS. However, Orange County's mortality rates appear to fluctuate annually, decreasing one year and increasing the next. This pattern continued until 2016, where colon and rectum cancer mortality rate began to steadily increase, reaching its highest point yet in 2017, at 17.0 per 100,000 [see Figure 57, Figure 58].

There are clear disparities when looking at mortality rates by race/ethnicity. Similar to the colorectal cancer incidence, colorectal cancer mortality is higher for the non-Hispanic Black population compared to those who are non-Hispanic White and Hispanic. However, the Asian/Pacific Islander population has the highest mortality rate by far at 40.9 per 100,000, despite the populations low incidence of colorectal cancer [see Figure 57].

## Lung and Bronchus Cancer

Lung cancer is the primary cause of cancer deaths, for both males and females, in all the Mid-Hudson Region and New York State. Some symptoms of lung cancer include chest pain, coughing (sometimes with blood), shortness of breath, and/or wheezing. The leading risk factor for lung cancer is tobacco use. According to the NYSDOH, smoking is responsible for $80 \%$ of lung cancers. Another risk factor for lung cancer is radon exposure. Radon is a colorless, radioactive gas that comes from the decay of elements such as uranium, which is found in soil and rock. Radon is in the surrounding air, so it is not possible to completely avoid it. However, preventive measures can be taken to lower exposure, such as utilization of radon detection kits in the home or office.

Between 2016-2018, Orange County had a Lung and Bronchus Cancer incidence rate (age-adjusted) of 62.7 per 100,000 population, which exceeds the NY state rate. When looking over time, the incidence of lung and bronchus cancer has not changed much in the county and the state (excluding NYC). Lung and bronchus cancer incidence differs between racial/ethnic groups, with non-Hispanic Whites in the county having the highest rate or 69.8 per 100,000 [see Figure 59, Figure 60].

The lung and bronchus cancer mortality rate remained relatively stable in Orange County, until 2016-2017, where there was a slight increase. This differed from NY State excluding NYC, where there was a decrease in lung and bronchus cancer mortality over time [Figure 61].

## Female Breast Cancer

Breast cancer is one of the most prevalent cancers in American women. The most common symptom of breast cancer is a lump or mass found in the breast. The average risk of a woman in the U.S. developing breast cancer in her lifetime is about 12\%.

As of the most recent data in 2017, the incidence rate of breast cancer (age-adjusted) in Orange County was 139.8 per 100,000 female population, which has been a slight increase from what the rate was back in 2010 (123.7) [see Figure 62]. Late-stage breast cancer incidence in the county (age-adjusted) averaged at 45.7 per 100,000 female population from 2016-2018, slightly above the New York State rate of 41.4. When stratifying by race, it is clear that non-Hispanic Black women suffer a much higher rate (59.2) of late-stage breast cancer incidence than other race/ethnicity in the county [see Figure 63].

Source: NYSDOH County Health Indicators by Race/Ethnicity (CHIRE), Updated as of March 2022
https://www.health.ny.gov/statistics/community/minority/county/orange.htm
Breast cancer mortality (age-adjusted) has been rising in Orange County since 2013 and has surpassed that of New York State, climbing from a rate of 18.6 per 100,000 female population in 2013 to 26.0 in 2017 [see Figure 64].

Similar to the breast cancer incidence, there are disparities in breast cancer mortality by race/ethnicity. Non- Hispanic Black women face the highest rate of breast cancer mortality, at 50.4 per 100,000 female population, which is double the rate for non-Hispanic Whites. The Asian/Pacific Islander rate is also disproportionately high at 39.2 per 100,000 [see Figure 65].

## Cervix Uteri Cancer

Cervical cancer/cervix uteri cancer occurs in the lower part of the uterus, or cervix. Most cases of cervical cancer are related to infection with human papillomavirus (HPV). The cervix uteri cancer incidence in Orange County has seen an increasing trend since 2010 and is higher than that of NYS excluding NYC. The mortality rate of cervix uteri cancer is also higher in Orange County than NYS excluding NYC, and it has been increasing since 2015 [see Figure 66, Figure 67].

## Promote A Healthy And Safe Environment

## Safety Injury

Injury is one of the leading causes of death in New York State, killing more than 7,250 New Yorkers each year. For New Yorkers aged 1-44 years, injury is the number one cause of death. According to the NYSDOH, "Injuries occur in predictable patterns, with recognizable risk factors, and among identifiable populations." Beyond death, consequences from injuries include financial burden, disability, poor mental health, and lost productivity. Injury is often broken out into two categories: intrapersonal violence and unintentional injuries. Unintentional injury may include traffic injuries, falls, drownings, and poisonings.

From 2019-2019, hospitalizations from unintentional injuries in Orange County occurred at a rate of 69.1 per 100,000 population, which is above the New York State rate. When stratifying by race/ethnicity, the non- Hispanic population has the highest rate at 65.3 per 100,000, and the Asian/Pacific Islander population has the lowest at 19.2 [see Figure 68].

Figure 68

Source: NYSDOH County Health Indicators by Race/Ethnicity (CHIRE), Updated as of March 2022 https://www.health.ny.gov/statistics/community/minority/county/orange.htm

The average mortality rate for accidents in Orange County from 2016-2019 was 45.5 per 100,000 population, which is similar to that of NYS excluding NYC. Mortality from accidents is highest among individuals 75 and older.

Among those younger than 75, 25-34-year-olds have the highest accidents mortality rate. When stratifying by race/ ethnicity, non-Hispanic Whites die more from accidents than other groups. All racial/ethnic groups in the county saw a lower rate of accident mortality in 2019 compared to 2018, except for the Hispanic group which the rate slightly increased. Zip code seems to also be associated with accident mortality rate, with those living in in 12771 having a much higher rate of accident mortality than other zip codes in Orange County [see Table 29, Figure 69, Figure 70].

## Vital Statistics, Office Of Vital

Statistics Falls

Falls account for a significant risk of injury for all age groups. Older adults aged 65 years and older are at the greatest risk for falls with more than one out of four experiencing a fall each year.

Consequences of falls:

- Cause $95 \%$ of hip fractures
- Cause fear, which can lead to decreased physical activity
- Commonly cause traumatic brain injury
- Account for $\$ 50$ billion in medical costs, $75 \%$ of which were covered by Medicare and Medicaid

Risk factors:

- Lower body weakness
- Certain medications
- Poor vision
- Environmental hazards, such as broken steps, throw-rugs, and clutter
- Vitamin D deficiency

From 2017-2019 the average fall hospitalization rate in Orange County was 218.8 per 10,000, which exceeds NY state's rate. Further, certain racial/ethnic groups are disproportionately affected by fall hospitalizations. The Non-Hispanic white population has the highest rate at 213.7 per 10,000, while the Asian/Pacific Islander population has the lowest, at 61.6 [see Figure 71].

## Promote Healthy Women, Infants, And Children

## Births

There was a total of 18,555 births in Orange County from 2016-2019. The average annual rate of births was 66.0 per 1,000 females aged $15-44$. Most births were given by women aged $25-44$, closely followed by those aged $20-24$. A small proportion of births in the county were given by teen mothers (aged 15-19). Birth rates have remained relatively steady over time, but have been consistently highest for non-Hispanic White and Hispanic populations, and the 10950 zip code [see Table 30, Figure 72, Figure 73, Figure 74].

## Maternal Health

Maternal mortality refers to the death of a person while they are pregnant, in delivery, or soon after giving birth. Maternal mortality and morbidity are key indicators of the overall health of a society. In the U.S., maternal mortality rates have doubled in the past decade, and these deaths are plagued with racial and ethnic disparities. In NYS in particular, black women are three times more likely to die from pregnancy-related complications than white women. In Orange County, the rates of maternal mortality have steeply increased from 2014 onward, reaching a rate of 39.1 per 100,000 live births in 2018. This rate far exceeds the PA 2024 goal of 16 per 100,000. [see Figure 75].

* Fewer than 10 events in the numerator, therefore the rate is unstable.

## Prenatal Care

Prenatal care is the health care received from medical providers during pregnancy, including checkups, physicals, and prenatal testing. Getting early and regular prenatal care in the first trimester can help keep mothers and their babies healthy, as it lets medical providers identify and treat health problems early. Of the mothers who do not get prenatal care, their babies are three times more likely to have a low birth weight and five times more likely to die.

From 2016-2019, an average of 69.1\% of births in Orange County had early (first trimester) prenatal care. There were disparities in prenatal care by age of the mother, and race/ethnicity. Births given to younger mothers were less likely to have prenatal care compared to births to older mothers [Table 31, Figure 76]. Non- Hispanic White births were more likely to have early prenatal care than non-Hispanic Black and Hispanic births, and births of "other" races/ethnicities were the least likely to have early prenatal care. While most demographics in the county experienced an increase in births with prenatal care from 2018 to 2019, births to mothers aged 15-17, Hispanic births, and "other "raced births continued to decrease in their early care coverage from [see Table 31, Figure 77]. Further, early prenatal care coverage has been decreasing consistently in zip code 12550 since 2017, while all other zip codes experienced a slight increase from 2018-2019 [Table 31, Figure 78].

Younger mothers were less likely to have prenatal care compared to births to older mothers. Non-Hispanic White births were more likely to have early prenatal care than non-Hispanic Black and Hispanic births, and births of "other" races/ethnicities were the least likely to have early prenatal care. While most demographics in the county experienced an increase in births with prenatal care from 2018 to 2019, births to mothers aged 15-17, Hispanic births, and "other"-raced births continued to decrease in their early care coverage from [see Table 31]. Further, early prenatal care coverage has been decreasing consistently in zip code 12550 since 2017, while all other zip codes experienced a slight increase from 2018-2019.

Adequate prenatal care has decreased in Orange County from 2011 until 2018. In 2018,63.2\% of births in Orange County had adequate prenatal care. This is worse than NYS excl. NYC where $77.3 \%$ of births had adequate prenatal care. While this number is a slight improvement from the previous year's rate of $61.5 \%$, Orange County is still worse than it was in 2011, when average was 71.1\%. [see Figure 79].

Original Data Source: Vital Statistics, Updated as of October 2021

From 2016-2019, an average of $5.1 \%$ of births in Orange County had late (last trimester) or no prenatal care. Births to younger mothers more frequently had late/no prenatal care. When stratifying be race/ethnicity, births of a race/ethnicity other than non-Hispanic White, non-Hispanic Black, or Hispanic were the most likely to have late/no prenatal care. Non-Hispanic Black and Hispanic births also more frequently had late/no prenatal care compared to non-Hispanic White births. When looking at zip codes, births given in zip code 10940 and 1771 had late or no prenatal care the most often [see Table 32, Figure 80, Figure 82, Figure 81].

## Adolescent Pregnancy

Teen pregnancy is currently at historic lows in New York State, and progress is being made nationwide. Evidence suggests that this decline in New York State may be attributable to teens abstaining from sexual activity, and more sexually active teens are using birth control. Despite this progress, the teen pregnancy rate in the U.S. is substantially higher than any other western industrialized nation. Poorer socioeconomic status conditions, such as lower education and lower income level, may contribute to higher rates of teen pregnancy. Teens in child welfare systems are also more likely to experience teen pregnancy. Teen pregnancy is a significant contributor to high school dropout rates. In the U.S., $50 \%$ of teen mothers graduate high school by age 22 , while $90 \%$ of women, who did not give birth during adolescence, received a high school diploma. The children of teenage mothers are more likely to have lower school achievement and drop out of high school; more health problems; become incarcerated at some point during adolescence; give birth as a teenager; and experience unemployment as an adult.

The rate of teen pregnancy in Orange County has been continuously decreasing since 2011. However, the current rate of 22.4 per 1,000 girls aged 15-17 years of age still exceeds the New York State excluding NYC rate of 18.8 per 1,000 [see Figure 83]. From 2016-2019, an average of $0.7 \%$ of live births in Orange County were births given by teen mothers ( 17 years of age or younger) and this percentage fluctuated year by year. A majority of these teen births were by mothers aged 15-17. When stratifying by race, the largest percentage of teen births were to Hispanic mothers [see Figure 84, Table 33].

## Adverse Birth Outcomes

## Preterm Births

Preterm birth is when a mother gives birth to a baby more than three weeks before its due date. Preterm babies, especially those born very early, often have medical complications. While these complications may vary, typically the more premature a baby is, the higher the risk for complications. Risk factors for premature birth include pregnancy with twins, triplets, or other multiples; conceiving through in vitro fertilization; smoking cigarettes or using illicit drugs; certain infections, especially those of the amniotic fluid and lower genital tract; certain chronic conditions, such as high blood pressure or diabetes; stressful life events; physical injury or trauma; and an interval of less than six months between pregnancies. Non-Hispanic Black women are more likely to experience premature birth than women of other races or ethnicities.

Short-term complications of premature birth may include problems with the blood, heart, brain, gastrointestinal system, and immune system. Additionally, there may be further complications with breathing, metabolism, and temperature control. Long-term complications of premature birth may include vision, hearing, dental, behavioral, and psychological problems. Additionally, complications may include cerebral palsy, impaired learning, and other chronic health issues.

From 2017-2019, an average of $8.1 \%$ of births in Orange County were premature. This is lower than the state average. However, there are disparities by race/ethnicity and zip code. When stratifying by race/ethnicity, the percentage of premature non-Hispanic Black births in Orange County far exceeds every other group and is also higher the state rate for that demographic. Further, there was a sharp increase in non-Hispanic Black premature births from 2018-2019 [Table 35, Figure 89, Figure 90]. Mothers who live in the three major cities in the county (12550, 12771, and 10940) have higher percentages of premature births than the 10950-zip code [see Table 35, Figure 91].

Low birthweight describes babies born weighing less than 2.5 kg ( 5 pounds 8 ounces). Over $8 \%$ of all births in the U.S. are low birthweight, and this percentage is increasing.

## Low Birthweight Births

Low birthweight describes babies born weighing less than 2.5 kg ( 5 pounds 8 ounces). Over $8 \%$ of all births in the U.S. are low birthweight, and this percentage is increasing. This is thought to be a result of an increased number of babies born prematurely in multiples. The primary cause of low birthweight is preterm birth. Preterm birth means a baby has less time in the mother's uterus to grow and gain weight.

Another cause of low birthweight is intrauterine growth restriction (IUGR). IUGR occurs when a baby does not grow adequately during pregnancy due to problems with the placenta, the mother's health, or the baby's condition. Babies with IUGR may be born at full term, but still have a low birthweight.

There are different risk factors that can contribute to a baby being born with low birthweight. Non-Hispanic Black babies are two times more likely to have low birthweight than non-Hispanic White babies. Babies born to teen mothers have a higher risk of having a low birthweight as well. Babies born in multiples are at an increased risk for low birthweight because they are often preterm. The health of the mother may also contribute to risk of low birthweight due to the mother's exposure to alcohol, cigarettes, and illicit drugs. Babies born to mothers of low socioeconomic status are also at a higher risk of being born with low birthweight due to poor nutrition, inadequate prenatal care, and pregnancy complications.

Babies with low birthweight have a higher risk of complications. They may have a harder time eating, gaining weight, controlling their body temperature, and fighting infections. Because many babies with low birthweight are also premature, it can be difficult to tell which problems are due to the premature birth and which problems are due to low birthweight. Generally, the lower the birthweight, the greater the risk for complications.

In Orange County an average of $6.6 \%$ of total births were low birth weight from 2016-2019, which is lower than the NY State average. However, both within Orange County and NY State, there are disparities in low birthweight births based on race/ethnicity, maternal age, and zip code. Non-Hispanic Black babies in Orange County face the highest percentage of low birthweight compared to non-Hispanic White, Hispanic, and babies of other races. This disparity has persisted over time. There was a decrease in low birthweight births for nonHispanic black babies from 2016 to 2017, but the percentage has increased every year since, at a much steeper rate than that for other racial/ethnic groups [Table 36, Figure 92, Figure 93]. Babies that have a low birthweight are also more often born to mothers who are younger than 20. When looking at zip codes, low birthweight births are more common in the three major cities in Orange County (10940, 12550, and 12771) compared to the 10950 zip code [see Table 36, Figure 59, Figure 95].

## Infant Mortality

Infant mortality is the death of an infant before their first birthday. It is an important indicator of both maternal and infant health, as well as the overall health of a society. The five leading causes of infant mortality in the
U.S. in 2020 were birth defects; preterm birth and low birthweight; Sudden Infant Death Syndrome (SIDS); injuries; and maternal pregnancy complications.

One of Healthy People 2020's objectives was to reduce the rate of all infant deaths to no more than six infant deaths per 1,000 live births. The risk of infant mortality can be reduced by increasing access to quality preconception, prenatal, and interconception care. Infant health is influenced by sociodemographic and behavioral variables, such as education, family income, and breastfeeding, but it is also associated with the physical and mental health of an infant's parents and caregivers.

Orange County had an average infant mortality rate of 3.6 per 1,000 live births from 2017-2019. This rate is better than the New York State rate; however, there is a large disparity amongst the non-Hispanic Black population which has a rate of 11.0 infant deaths per 1,000 live births, compared to 2.2 for non-Hispanic Whites. Though the infant mortality rate for all racial/ethnic groups decreased from 2015 to 2018, the rate for the black population remained much higher than all others [see Figure 96, Figure 97].

## Child Health

Child and Adolescent Mortality in Orange County has, overall, decreased from 2010-2017. However, after a consistent decrease from 20102015 From 2014-2015, the rates started increasing again and have continued to do so. Despite this recent increase in child and adolescent mortality, the most recent 2017 rate of 18.7 per 10,000 still meets the MCH 2020 goal [see Figure 98].

# PROMOTE WELL-BEING AND PREVENT MENTAL HEALTH SUBSTANCE USE DISORDERS 

## Mental Health

## Substance Use

Substance use refers to the recurrent use of substances, such as nicotine, alcohol, and/or opioids. Drug addiction, also called substance use disorder, can affect a person's brain and behavior, and interfere with meeting responsibilities at school, work, or at home. It increases the risk of social, physical, and mental health problems. These include teenage pregnancy, HIV/AIDS, STIs, domestic violence, crime, homicide, and suicide. According to the National Survey on Drug Use and Health (NSDUH), 40.3 million Americans (aged 12 years and older) battled a substance use disorder in 2020.

The rate for All-Emergency Department visits involving any drug overdose in Orange County has fluctuated over time in Orange County. The most recent rate in 2019 was 194.3 per 100,000 population, which is slightly lower than the rate for New York State excl NYC [see Figure 99].

Figure 99

Note: Singe-year estimates are graphed above.
Source: New York State Opioid Data Dashboard, Updated as of January 2022
https://webbi1.health.ny.gov/SASStoredProcess/guest? program=/EBI/PHIG/apps/opioid dashboard/op dashboard\&p=ctr\&ind id=op19\%20\&cos=33
Original Data Source: SPARCS Data, Updated as of November 2021

## Opioid Use

Opioids are a class of drugs that include illicit drugs, such as heroin; synthetic opioids, such as fentanyl; and prescription pain relievers, such as oxycodone, hydrocodone, and morphine. According to the CDC, in 2019, $70 \%$ of drug overdoses involved an opioid, and the amount of overdose deaths involving an opioid increased by over 6 percent from 2018.

In 2019, the rate of all Emergency Department visits involving any opioid in Orange County was 62.8 per 100,000, which was an improvement from the previous year. It is also lower than the rate for New York State excluding NYC. [see Figure 100]. On the other hand, overdose deaths in the county have increased steadily over time, from 7.0 per 100,000 in 2010 to 29.5 in 2018. Despite Orange County seeing an improvement from 2018-2019, dropping down to 22.5 deaths per 100,000, the county's rate is still higher than that of NYS excl. NYC [see Figure 101].

[^16]Figure 100

Vital Statistics Data, Updated as of November 2021
Buprenorphine is an opioid used to treat opioid addiction. It helps diminish the effects of withdrawal symptoms and lowers the risk of misuse. The opioid effects of buprenorphine increase with each dose until they level off, even when dosage increases.

From 2015-2020, the rate of buprenorphine prescription for opioid disorder has steadily increased in both Orange County and NY State. [see Figure 102].

Figure 102

The overall opioid burden, which includes outpatient Emergency Department visits and hospital discharges for non-fatal opioid overdose, abuse, dependence, and unspecified use; and opioid overdose deaths has continuously decreased since 2016 in both Orange County and in NY State. The most recent 2019 rate of opioid burden in Orange County was 253.4 per 100,000, which, even though lower than previous years, is still slightly higher than that of NY state excl NYC [see Figure 103].

## Drug-Related Arrests

The rate of drug arrest (Penal Law Article 220 for Controlled Substances, excluding Penal Law Article 221 for Marijuana) in Orange County was 37.7 per 100,000 in 2019, which is a decrease from the previous year's rate of 51.2. Over time, the drug arrest rate has been consistently higher in Orange County compared to the rest of NY stateS excl. NYC [see Figure 104].

## Alcohol

In Orange County, the most recently reported rate of alcohol-related motor vehicle injuries and deaths was 34.9 per 100,000, similar to the rate in NY stateS excl. NYC, of 35.1. From 2009-2019, the rates of alcohol-related motor vehicle injuries and deaths in both Orange County and NYS state excl. NYC have decreased [see Figure 105].

Figure 105

Binge drinking is defined as drinking 5 or more drinks on an occasion for men or 4 or more drinks on an occasion for women. The percentage of adults in Orange County who reported binge drinking in the past month has decreased slightly over time, from $17.2 \%$ in 2013-2014 to $16.1 \%$ in 2018. The rates of self-reported adult binge drinking are slightly lower in Orange County than in the rest of NY the state (excl. NYC) [see Figure 106].

https://health.data.ny.gov/Health/Behavioral-Risk-Factor-Surveillance-System-BRFSS-H/isy7-eb4n

The rate of arrests for Driving While Intoxicated (DWI) has slightly increased over time in Orange County, from 33.7 per 10,000 in 2016 to 36.9 in 2019. This is opposite of the trend in NY state excl. NYC, where DWI arrests have decreased over time. From 2016-2019, the rate of DWI arrests in Orange County have been consistently higher than that in NY state excl. NYC [see Figure 107].

## Neonatal Withdrawl

Newborns who are exposed to certain substances during pregnancy, such as opioids, alcohol, and nicotine, may develop withdrawal symptoms post-birth, otherwise known as neonatal abstinence syndrome (NAS). NAS babies face significant risk of morbidity and mortality from neurodevelopmental effects. Long-term consequences include neurodevelopmental delays, behavioral issues, and when left untread, death.

In Orange County, the rate of newborns with neonatal withdrawal symptoms or affected by maternal use of drug addiction has dropped notably over time, from 17.7 per 1,000 newborn discharges in 2016 to 9.1 in 2019. Orange County's rate was higher than that of NY state excl. NYC in 2016 but dropped below it by 2017 and has since remained lower [see Figure 108].

## Suicide \& Self-Inflicted Injury

In the U.S., suicide is a serious health problem. It is associated with several risk factors, including those who have experienced bullying, sexual violence, and child abuse. In 2020, 12.2 million American adults considered attempting suicide, and 46,000 died by suicide. Protective factors, such as connectedness with family and friends, as well as access to health care services, can help prevent suicide.

Suicide mortality in Orange County remained relatively stable from 2011-2016, and it dropped to 7.3 in 2015, almost reaching the PA 2020 goal of 7.0 per 100,000. However, there has been a marked increase in suicide mortality beginning in 2016, reaching 10.0 per 100,000 in 2018, shifting the county far from its PA 2024 target goal [see Figure 109].

When looking specifically at youth suicides in the county, there was a steady increase in mortality from 2011-2014. From 2014-2016, suicide mortality decreased sharply, leveling out at a rate of 2.3 per 100,000 which met and surpassed the PA 2024 goal of 4.7 per 100,000 [see Figure 110].

https://webbi1.health.ny.gov/SASStoredProcess/guest? program=/EBI/PHIG/apps/dashboard/pa dashboard\&p=ctr\&ind id=pa63 0\%20\&cos=33 Original Data Source: Vital Records, Updated as of November 2021

The overall self-inflicted injury hospitalization rate (age-adjusted) in Orange County was 4.5 per 10,000 in 2018, which is not a significant change from the previous year's rate of 4.7 and is similar to the rate in NYS excl. For teens aged 15-19, the rate of self-inflected injury was higher than that of the total population, at 7.1 per 10,000 in 2018. Though self-inflicted injuries for teens in Orange County are more frequent relative to the whole population, they were less frequent than self-inflicted injuries for teens at the state level (excl. NYC). Note that the rates from 2016 onward cannot be compared with the rates from 2014 and prior due to SPARCS data transitioning from ICD-9-CM to ICD-10-CM diagnosis codes [see Figure 111, Figure 112].

## PREVENT COMMUNICABLE DISEASES

## Sexually Transmitted Infections

HIV/AIDS

HIV (human immunodeficiency virus) is a virus that attacks the body's immune system and is spread through certain body fluids, including blood, vaginal and rectal secretions, semen, and breast milk. No effective cure for HIV exists, but the virus can be controlled with proper medical care. If left untreated, HIV can lead to AIDS (acquired immunodeficiency syndrome). It is estimated that $91 \%$ of new HIV infections in the U.S. are transmitted from undiagnosed people or those who have received a diagnosis but are not in care. People who are tested and learn they are HIV-positive can make changes to reduce the risk of transmitting it to their sexual or drug- using partners significantly. The only way to know whether you have HIV is to be tested for it.

HIV/AIDS infections continue to be a substantial public health issue in New York State and the U.S. as a whole. From 2014-2018, there were a total of 109 HIV infections in Orange County, at an annual average rate of 5.8 infections per 100,000 population. This is lower than the rate in the rest of the Mid-Hudson Region and NYS (excl. NYC). However, the rates have increased over time, from 3.5 per 100,000 in 2014 to 7.0 per 100,000 in 2018 [see Table 37]. When adjusting for age and stratifying by gender, age, and race, HIV/AIDS had disproportionate impacts. Males suffered higher incidence of both HIV and AIDS when compared to females. For HIV, the most frequently infected population was persons aged 50-59, closely followed by persons aged 25-29. For AIDS, however, the 50-59 population by far had the highest infection rate. Where data are available, the non-Hispanic Black population suffered the highest rates of both HIV and AIDS, followed by the Hispanic population. However, the highest proportion of persons living with diagnosed HIV/AIDS was for those who are a race/ethnicity "other" than non-Hispanic White, non-Hispanic Black, or Hispanic [see Table 38, Figure 113, Figure 114, Figure 115].

Most HIV transmission in Orange County occurs through sexual contact, including between men who have sex with men and sexual partners. The most common mode of transmission for AIDS infections in the county is heterosexual contact, followed by contact between men who have sex with men [Table 39, Figure 116].

There have been 10,046 deaths among persons diagnosed with HIV/AIDS from 2014-2018 in New York State, 76 of which have occurred in Orange County. The mortality rate for HIV/AIDS in Orange County was lower than in most other counties in the Mid-Hudson region, surpassing only the mortality rates Putnam and Rockland counties [see Table 40].

## Gonorrhea

Gonorrhea is an STI that can infect individuals of all genders. Gonorrhea can cause infections in the genitals, rectum, and throat. Gonorrhea can affect people of all ages but is especially common among young people aged 15-24 years. Gonorrhea is spread by vaginal, anal, or oral sex with an infected partner. Pregnant women with gonorrhea can also pass the infection on to babies during childbirth.

Healthy People 2020 aimed to reduce gonorrhea rates among females aged 15-44 years to 251.9 cases per 100,000 population and to 194.8 new cases per 100,000 for males aged 15-44 years by the year 2020. Orange County met these goals, having a case rate of 77.8 per 100,000 population in 2019, 67.8 per 100,000 females, and 88.5 per 100,000 males [see Table 41]. Despite having net the Healthy People 2020 goal, the gonorrhea case rates in Orange County have overall increased, from 60.0 in 2013 to 77.8 in 2019. From 2018 to 2019, the case rate jumped by more than 10 per 100,000. There are also disparities in which populations are the most affected by gonorrhea. When stratifying by race/ethnicity, the non-Hispanic Black population in Orange County had the highest rates of gonorrhea from 2013-2019. Males also had a higher rate of gonorrhea than females, and those aged 20-24 had higher rates than any other age group [see Figure 117, Figure 118, Figure 119, Figure 120].

## Chlamydia

Chlamydia is a common STI that can infect people of all genders. While Chlamydia can be treated easily, it can cause serious damage to the reproductive system if left untreated. Chlamydia is spread by vaginal, anal, or oral sex with a partner who has Chlamydia. Someone who was treated for chlamydia in the past can still become infected again through unprotected sex with another person who has Chlamydia. Pregnant women can also pass Chlamydia on to their babies during childbirth.

Chlamydia case rates have been increasing consistently in Orange County since 2013, raising from 291.6 per 100,000 in 2013 to 452.0 in 2019 [see Figure 121]. The non-Hispanic Black population in the county has been the most affected by gonorrhea, with an annual average of 724.5 cases per 100,000 population from 2013-2019. Chlamydia is much more common amongst females than males, at an annual average rate of 532.7 cases per 100,000 compared to 223.5 , respectively. The case rates are highest for 20-24-year-olds. All these trends are consistent with those of NYS excl. NYC [see Figure 121, Figure 122, Figure 123, Figure 124].

## Syphilis

Syphilis is a curable STI that can have very serious complications when left untreated. Syphilis is spread through direct contact with a syphilis sore during vaginal, anal, or oral sex. Sores may be located on or around the penis, vagina, anus, lips, in the mouth, or in the rectum. Syphilis can also spread from pregnant women to their babies. Syphilis is divided into primary, secondary, latent, and tertiary stages. Any sexually active person can contract syphilis through unprotected vaginal, anal, or oral sex. The CDC recommends all pregnant women be tested for syphilis at their first prenatal visit and during the third trimester.

Syphilis cases have been increasing dramatically in Orange County since 2011, rising from a rate of 2.8 per 100,000 in 2011 to 19.2 in 2018. Current rates of syphilis in the county surpass those of NYS excl. NYC [see Figure 125].

## PRIORITIZED COMMUNITY HEALTH NEEDS

## *Source includes extraction from the Orange County Community Needs Assessment:

As a result of the overall findings listed throughout this Community Needs Assessment inclusive of the Mid-Hudson Region Survey, the Orange County Assessment, Community Asset Survey, and various community events held across the county allowing residents to express their concerns to participate in a Rock Voting Exercise, which was organized by Orange County, the overarching themes include:

## Strengths:

- Low Crime and Safe Neighborhoods
- Access to Good Education
- Parks and Recreation

## Areas to Focus Resources:

- Better Jobs and Economy
- Access to Basic Healthcare
- Improve Public Transportation
- More Affordable Housing

Health Issues:

- Drug Use (prescription and illegal)
- Mental Health (depression, anxiety, stress)
- Aging Problems (Alzheimer's, arthritis, hearing/vision loss, etc.)

## Public Health Summit Findings

The Orange County Public Health Summit was held on June 28th, 2022 with approximately 100 partners including hospitals, health care providers, community-based organizations, and academia to review the current state of health in Orange County; identify and discuss the forces that impact the health of residents; provide input on selecting the two Prevention Agenda Priorities for the 2022-2024 CHIP; and participate in breakout sessions to discuss current efforts, assets, and barriers in each of the five priority areas. MSLC was an active participant in this summit, with members of our clinical leadership teams in attendance to discuss MSLC's specific experiences and findings within our patient database.

This year's theme "A Collaborative Approach to Community Health Planning" emphasized the need to engage all segments of the community to improve health outcomes together.

An overview of the most recently available data was provided to participants covering:

- Secondary data overview in each of the five NYSDOH Prevention Agenda areas
- Preliminary findings of the Community Asset Survey
- 2022 Community Partner Survey and focus groups with local human service providers data overview
- Preliminary results from resident's priority area choices though Rock Voting

A representative from the NYSDOH Center for Environmental Health provided an overview of the current science and advances in wastewater surveillance. Discussions of the current COVID-19 wastewater surveillance efforts across NYS with an emphasis on Orange County's robust program. Wastewater surveillance is an important tool to help predict trends in disease prevalence prior to receiving laboratory results. At the time of the summit, Orange County has six wastewater treatment facilities participating the statewide network.

A Forces of Change Assessment (FOCA) was also performed to identify the forces that impact the health of our residents and the local public health system's ability to operate. The FOCA was conducted for the first time at the Public Health Summit. Nearly 90 partners participated in the brainstorming session.

Following the FOCA, attendees had the opportunity to attend one of five health priority breakout sessions. Each breakout session discussed the following questions, as they pertain to the priority areas:

- What are we currently doing in this area?
- What collation, task force or partner is working in this area?
- What do we need to do?
- Are there any evidence-based interventions that are currently being used or could be used?
- Who else needs to be involved?

Prior to breakout group discussions, summit participants were asked to vote on the two priority areas the health departments, hospitals, and community should focus on for the next three years. The two priority areas identified were:

1. Promote Well-Being and Prevent Mental and Substance Use Disorders
2. Promote Healthy Women, Infants, and Children

| Priority Area | $\mathbf{1}^{\text {st }}$ Choice Votes | 2nd $^{\text {Choice Votes }}$ |
| :--- | :---: | :---: |
| Prevent Chronic Diseases | $\mathbf{5}$ | $\mathbf{1 4}$ |
| Promote a Healihy and Safe Environment | $\mathbf{2}$ | 15 |
| Promote Healihy Women, Infants, and Children | $\mathbf{2 4}$ | $\mathbf{2 5}$ |
| Promote Well-Being and Prevent Mental and Substance <br> Use Disorders | $\mathbf{2 9}$ | $\mathbf{2 3}$ |
| Prevent Communicable Diseases | $\mathbf{5}$ | $\mathbf{6}$ |

Breakout sessions' themes included:

- Preventing Chronic Diseases workgroup focused on needs for chronic disease treatment and prevention navigators and directories across the county, as well as connecting patients to providers that speak their native language.
- Promoting a Healthy and Safe Environment workgroup discussed decreasing water contamination, substance abuse, gang violence, mitigation of food insecurity, language barriers and senior concerns.
- Promoting Healthy Women, Infants, and Children workgroup discussed the importance of building community, systemic change, policy change, and implementing doula programs to decrease the maternal mortality rate amongst non-Hispanic Black and Hispanic women.
- Promoting Well-Being and Prevent Mental Health and Substance Use Disorder workgroup emphasized the importance of preventative mental health care, increased community engagement, partner accountability, language barriers, lack of funding, and focusing on advocacy.
- Preventing Communicable Diseases workgroup discussed the need for on-demand PrEP, substance abuse treatment and Hepatitis C testing, syringe exchange programs, needle exchange programs, sex worker support, and reducing hospital acquired infections.

## Community Partner Focus Groups and Survey

## Overview

Though the various Community Themes and Strengths Assessments gather information from a variety of sources and from various segments of the population, there are some groups that many not be fully accounted for. To ensure that all members of the local public health system and community are included in the CHA process, community partner focus groups and an online survey were created. Special focus was placed on agencies and partners that work with low-income, veterans, seniors, people experiencing homelessness, LGBTQ+ members, and residents with a mental health diagnosis. In order to ensure that the needs of these populations were met, focus groups were conducted with partners that serve these populations. The reason for doing focus groups with partners, rather than directly surveying the target population through convenience sampling, was that a convenience sample risks only accounting for those who are already accessing services and care. The hope in surveying partners was that they would have an idea of what obstacles and barriers these population face when accessing services. An online survey was also created so that partners that could not attend a focus group could also provide input.

The Orange County Department of Health conducted two focus groups. The first was with the Joint Membership of Health and Community Agencies (JMHCA). Their focus is on providing residents of Orange County with a welcoming, comprehensive, and seamless service delivery system for recovery, health, and wellness. The second was with the Changing the Orange County Addiction Treatment Ecosystem. Discussions were centered around the survey questions distributed prior to the focus groups. Focus group attendees included organizations such as Rehabilitation Support Services, Regional Economic Community Action Program (RECAP Inc.), Mental Health Association, Action Towards Independence, Fearless!, Orange County Department of Mental Health, and the American Lung Association. In addition, the survey was e-mailed out to human service providers throughout Orange County through the JMHCA, Changing the Ecosystem, and Resiliency Committee listservs.

The online survey was also shared, and 45 responses were collected from providers that serve various underserved populations including persons with disabilities, people with a substance use disorder, persons with a mental health diagnosis, persons experiencing homelessness, low-income individuals, and veterans.

The survey showed that the top three issues that affect health in Orange County were:

- Access to affordable, decent, and safe housing
- Access to mental health providers
- Access to affordable, reliable, personal, and public transportation

The survey also showed that the top three barriers to people achieving better health in Orange County were:

- Drug and/or alcohol use
- Knowledge of existing resources
- Health literacy

Issues highly impacting health in the communities as listed by survey respondents include:

- Mental health and substance abuse issues
- Maternal and child health issues
- Chronic disease
- Health disparities

The focus groups had similar findings and gave an opportunity for agency providers to expand upon these issues and barriers. Of note was the discussion about the surge in mental health needs and substance use specific to youth. The consensus was that Orange County needs to expand services specific to youth, implement prevention programs, and work with schools to expand education and prevention opportunities.

## Major Survey Findings

A lack of affordable and/or consistent transportation is a major issue for many residents of Orange County. This includes lacking the financial means to get to and from appointments/work, a lack of available public transportation, and an absence of knowledge of the transportation options that are available ( $n=13$ ).

Affordable and safe housing is a challenge for many. This leaves many people homeless, or at the least, economically distressed ( $n=7$ ) Language barriers between the residents and service providers exist which can cause confusion and lack of adequate care ( $n=4$ ).

An overall lack of knowledge of the resources that are available to the community exists. While there are many programs in place to assist residents, they can only be utilized when there is a knowledge and understanding of these services ( $n=6$ ).

Mental health/addiction issues continue to plague our communities. This is in the form of mental health stigma, lack of providers, and the large number of individuals who are facing active addiction ( $n=7$ ).

Top Rated Barriers to Achieving Better Health in Orange County ( $\mathrm{n}=45$ )

The Impact of Health Issues in Orange County ( $\mathrm{n}=45$ )

## Impact of COVID-19

According to the Orange County Department of Health Findings, as a result of the COVID pandemic, some of the existing issues in mental health have worsened. Available mental health providers have declined while mental health issues among the community have increased ( $\mathrm{n}=11$ ).

The COVID pandemic has also opened the door to virtual appointments for healthcare. While this has its benefits, there are also drawbacks to the lack of face-to-face interaction that comes with an in-person visit. Many residents are hesitant to come in person due to COVID concerns and/or they enjoy the convenience of not having to leave home. Providers are also hesitant to bring too many people into the office for fear of spreading COVID, as well as entering the homes of their patients for in home care ( $n=30$ ).

At MSLC, as referenced earlier in this document, Emergency Department visits significantly declined in 2020-2021, with volume beginning to trend up in recent months.

## The Orange County Community Needs Assessment 2022-2024 references the following recommendations:

Holistic care management services dedicated to address the social determinants of health in every touch point in the systems where a client or patient may show up to address root causes of health issues.

Continuing to break down the silos of care for the complicated systems that patients/clients must navigate to address their health issues.
Expand availability of telehealth/tele-video services and broadband expansion for those that struggle with mental health issues, homelessness, and substance use.

There is a need for prioritization from local leaders to address the social determinants of health such as poverty, housing, and transportation and develop strategic opportunities for communities to work together and to build community awareness of these issues.

## Community Asset Survey (CAS)

## Overview

The Community Asset Survey (CAS) was developed by the Orange County DOH. It includes 5 questions with 2 demographic questions and 3 primary questions. The demographic questions ensure the respondent is an Orange County resident and asks what their ZIP Code is. The primary questions ask residents what the greatest strengths of the community are, where should community efforts be focused to improve quality of life, and what the most important health issues are.

## Methodology

The survey was created and tested February 2022. The survey was tested with Orange County employees before community-wide dissemination. The survey was disseminated online and in-person via tablet at various community events. English and Spanish surveys were offered, and the majority of the responses were in English. The survey responses were anonymous.

A convenience sample was used. Previous online surveys have over-sampled women and those over 65 years old and under-sampled residents who are from lower socio-economic households. Orange County DOH Public Health Fellows went in person to venues that would ensure a broader sample of residents.

Some of the community events where residents were asked to complete the survey were: Orange County DOH community listening sessions (Port Jervis, Middletown, Blooming Grove, Chester, Cornwall, Pine Bush, Goshen and Newburgh), farmer's markets, libraries, Mount Saint Mary College Campus Desmond Center, Newburgh Illuminated, and National Night Out (Middletown, New Windsor, Newburgh, Warwick, Port Jervis, and the Town of Crawford).

Hospitals in Orange County shared the survey link with staff and residents. Two federally qualified health centers, Sun River Health and Ezras Choilim Health Center, shared the link with their staff and community. Orange County Government shared the link with employees. Orange County DOH shared the link on the Facebook page. Partner agencies shared the link with staff and customers. Flyers were distributed at events and libraries.

## Results

Through the efforts of the Orange County DOH and partners, a total of 928 surveys were completed.
The first question, "Do you live in Orange County?" ensured that only residents of the county completed the survey.
The second question, "What is your ZIP code?" provided the Orange County DOH information to better focus outreach efforts and try to ensure a distribution of responses similar to the Orange County population. As surveys were gathered, responses were studied in an effort to conduct outreach in ZIP codes without any responses [see Table 1]. After XX months of effort, no responses were gathered from Arden (10910), Bellvale (10912), Middletown (10943), New Milford (10959), Southfields (10975), Sterling Forest (10979), Thompson Ridge (10985), West Point (10997) and Vails Gate (12584).

| 10919 | 0.4\% | 4 | 12584 | 0.0\% | 0 |

Figure 1 and Table 2 represent the percentage of responses and population from the ten leading ZIP codes with the highest survey response. Per the US Census, the ten leading ZIP codes represent $62.3 \%$ of the Orange County population and $66.5 \%$ of the survey responses. The majority of respondents ( $25.0 \%$ ) lived in Monroe and Middletown, and this represents $23.2 \%$ of the Orange County population. The survey sample was overrepresented in these ten ZIP codes by 4.2\%.

| Top Ten Responses to Question \#2 - What is you ZIP Code? |  |  |  |
| :---: | :---: | :---: | :---: |
| ZIP Code | Population in ZIP Code | Percent of Orange County Population | Percent of Survey Respondents |
| 10950 | 47,226 | 11.5\% | 13.5\% |
| 10940 | 48418 | 11.7\% | 11.5\% |
| 12550 | 54,447 | 13.2\% | 8.6\% |
| 10924 | 13120 | 3.2\% | 8.5\% |
| 12553 | 24,438 | 5.9\% | 5.6\% |
| 10941 | 13779 | 3.3\% | 4.2\% |
| 10918 | 11,647 | 2.8\% | 4.1\% |
| 10990 | 20631 | 5.0\% | 3.7\% |
| 12771 | 14,511 | 3.5\% | 3.7\% |
| 10930 | 8958 | 2.2\% | 3.1\% |
| Total | 412,135 | 62.3\% | 66.5\% |

The third question was "What are the greatest strengths of our community?" and respondents were able to pick their top three choices.
The top five greatest strengths of our community in ascending order were: access to good education (42.9\%), low crime and safe neighborhoods (37.8\%), parks and recreation (35.8\%), access to basic healthcare (31.4\%) and clean environment (21.3\%) [see Figure 2].

Note: Participants were allowed to choose up to three responses; therefore, total percentages will not add up to $100 \%$.
Table 2 shows all responses ranked from highest to lowest with their corresponding percentages and number of responses. Responses from all five Prevention Agenda areas were represented as well as social determinants of health.

Rock Voting Jars, Orange County Department of Health, 2022

## Rock Voting

The New York State Prevention Agenda outlines five priority areas in health improvement efforts: (1) Preventing Chronic Disease; (2) Promoting Well-Being and Preventing Mental Health and Substance Use Disorders; (3) Promoting a Safe and Healthy Environment; (4) Preventing Communicable Disease; and (5) Promoting Healthy Women, Infants, and Children. Local health departments and hospitals select two of these five priorities on which to focus their community health improvement plans, based on a variety of factors including demographic data, health and behavioral indicators, and community feedback. The Orange County Department of Health invited county residents to participate in "Rock Voting," an interactive method of assessing community perceptions of the highest priority prevention agenda areas. Each participant was given two rocks and presented with labeled jars representing the five priority areas. They were tasked with placing their rocks in the two areas they perceived as needing the most attention. Over 1,500 community members participated in the activity from April 2022 to August 2022. Survey locations included the Farmer's Markets of Goshen, Newburgh, Middletown, Port Jervis, and Warwick; Senior Health and Fitness Day; Yoga Events hosted by the Desmond Center; Freedom Fest; National Night Out in Newburgh, Middletown, Port Jervis, Wallkill, New Windsor, and Crawford; Deacon Jack Seymour Food Pantry in Newburgh; and Listening Sessions hosted by the Orange County Dept. of Health in Port Jervis, Middletown, Blooming Grove, Chester, Crawford, and Goshen.

Rock Voting at a Desmond Center Event, Mount St. Mary College, 2022
The top two priority areas that residents voted for were: Promoting Well-Being and Preventing Mental Health and Substance Use Disorders (36.4\%) and Promoting Healthy Women, Infants, and Children (26.0\%) [see Figure 126].

## Listening Sessions

## Background

Listening sessions were conducted by the Orange County Department of Health (OCDOH) at municipalities throughout the county to reintroduce the OCDOH to the public since the beginning of the COVID-19 pandemic; and to discuss current health concerns within each community as part of the Community Health Assessment process. OCDOH hosted listening sessions in Port Jervis, Middletown, Blooming Grove (Washingtonville), Chester, Newburgh, Cornwall, Crawford/Pine Bush, and Goshen, between April 2022 to June 2022. Listening sessions were advertised through various formats including social media platforms, street outreach, coalitions with community members including the faith-based community and posting flyers in heavily trafficked businesses including post offices, laundromats, libraries, and small businesses like foodservice, retail, and beauty shops.

During each listening session, a presentation about OCDOH's services was provided to attendees and the remaining time was spent discussing the community's health concerns. Attendees completed the Community Assessment Survey to help determine the most pressing issues in the county and participated in Rock Voting, to provide their opinion on the health priority areas to be addressed through the Community Health Improvement Plan. The former Commissioner of Health, Dr. Irina Gelman, was present at all listening sessions as well as staff from the Divisions of Epidemiology, Community Health Outreach, and Health Equity.

Town of Cornwall Listening Session, 2022

## Findings

OCDOH was able to gather valuable information from community members during the open floor discussion. Although listening sessions were hosted in various parts of the county, main areas of concern were often similar. Common themes discussed include mental health, affordable housing, the need for increased OCDOH outreach efforts, and questions pertaining to communicable diseases.

Mental health was overwhelmingly an area of concern in most of the listening sessions. Middletown attendees discussed mental health decline amongst students and educators during and following the COVID-19 pandemic. Blooming Grove attendees discussed the need to receive assistance from $O C D O H$ on how to discuss mental health, especially within primary school-aged students and parents.

Suicide prevention in schools was discussed by Chester attendees, suggesting there be a follow-up system for students who have attempted suicide in the past. Newburgh attendees emphasized the importance of mental health resources being made apparent and available in schools, such as therapy. Lack of mental health beds on the eastern side of Orange County was highlighted by Cornwall attendees, stating that the nearest adult inpatient mental health facility is Garnet Health Medical Center in Middletown and that there are no inpatient mental health facilities specifically for children in the county at all. Goshen attendees stressed the lack of health insurance coverage for mental health services and how this creates barriers in accessing professional help. Mental health concerns persist throughout all areas of Orange County.

Affordable housing was discussed in three of the eight listening sessions. Newburgh attendees mentioned how the current housing crisis is contributing to the mental health crisis. Cornwall attendees discussed the need for affordable housing programs in their town, with one attendee relaying a personal excerpt about a family who was struggling to keep their children enrolled in the Cornwall Central School District due to inflation of housing costs. Lack of affordable senior housing was discussed by Goshen attendees, stating that waitlists to get into current affordable senior housing can take about two to five years, and the quality of the current housing is poor. Affordable housing is a concern for all age groups and is related to other public health concerns, including mental health, homelessness, and poverty.

Many listening session attendees requested increased outreach efforts from OCDOH, including creating a better rapport with community members across the county. Port Jervis attendees discussed the disconnect between their community and OCDOH, stating that OCDOH methods of disseminating information and providing services does not necessarily align with older generations and people of all cultures. Middletown attendees requested that OCDOH become more involved in the school systems, especially with outreach pertaining to mental health.

Blooming Grove attendees discussed increasing contact between OCDOH and local business and associations, in order to normalize conversations about health within their community. If OCDOH , school districts, and local businesses work in concert, many health gaps in the county may be identified and addressed in a more productive manner.

Almost every listening session participated in discussions regarding communicable disease, such as COVID-19 and/or Monkeypox. Port Jervis attendees relayed their positive feedback for vaccination clinics within Orange County, and their hopes for them to continue. They also voiced their concerns with the availability of at-home COVID-19 tests and vaccine mandates for healthcare workers. Middletown attendees inquired about the decision-making process for school closings in response to an influx of COVID-19 infection in the county. COVID- 19 testing and travel questions were asked and answered during the Chester listening session. Goshen attendees asked about the next COVID-19 booster and when the most effective time to receive boosters. Crawford/Pine Bush and Goshen attendees requested clarification on Monkeypox and the impact in Orange County.

## Future

As of August 2022, the Orange County Department of Health has been able to host eight listening sessions in 2022, with plans to host more throughout the county. Discussions held in each listening session were constructive and informative for both the public and OCDOH. An increase in listening session advertisement and outreach should ensure a larger audience, which may lead to more robust conversations. Overall, listening sessions have proven to be a conducive way for OCDOH and local community members to connect and discuss pertinent health concerns and elicit feedback for community input on Orange County's health needs.

Village of Chester Listening Session, 2022

## Mid-Hudson Regional Community Health Survey

## Overview and Methodology

The Siena College Research Institute (SCRI), on behalf of seven Hudson Valley Health Departments, conducted a public opinion survey of 5,699 Hudson Valley New York State residents from March 14 - May 22, 2022. The Hudson Valley is comprised of Dutchess, Orange, Putnam, Rockland, Sullivan, Ulster and Westchester Counties in New York. Residents aged 18 and older were interviewed from within those counties in New York State so as to ensure representative county-wide samples. The margin of error for the total sample of 5,699 is +/- $2.1 \%$ including the design effects resulting from weighting with a $95 \%$ confidence interval. This means that in 95 out of every 100 samples of the same size and type, the results we obtain would vary by no more than plus or minus 2.1 percentage points from the result we would get if we could interview every member of the population. The overall sample of 5,699 was weighted by age, gender, reported race/ethnicity, income and county using the 2015-2020 American Community Survey 5 -year estimates to ensure statistical representativeness.

Respondents were contacted via landline telephone, cell phone, an online panel, and online recruitment from each county at various in-person events and other community partnerships to enhance representation and meet budget constraints. The design of the landline sample was conducted so as to ensure the selection of both listed and unlisted telephone numbers, using random digit dialing. The cell phone sample was drawn from a sample of dedicated wireless telephone exchanges from within New York State. Respondents were screened for residence in New York State and specified counties. Data from all four sources were combined and weighted as one universe to provide a representative sample of Hudson Valley residents.

Calls were made between the hours of 1 pm and 9pm Monday through Thursday, and between 2 pm and 8pm on Sundays. Landline telephone numbers were purchased from ASDE Survey Sampler. Cell phone telephone numbers were purchased from Dynata (formerly Survey Sampling International). Up to 7 calls were placed to each phone number to try to establish if the phone number was a working number. Telephone surveys were conducted in English or Spanish.

The online sample was provided by Lucid, a market research platform that runs an online exchange for survey respondents. The samples drawn from this exchange matched a set of demographic quotas on age, gender, and region. Respondents were sent from Lucid directly to survey software operated by the Siena College Research Institute. All respondents that took the survey online completed an attention check before taking the survey.

Additional attention checks were placed in the survey to ensure proper attention was being paid throughout the entire survey. Online panel surveys were conducted in English. The online recruitment from each county included distributing the survey URL to community partners, promoting the survey on social media and providing access to the survey at community events. The online recruitment survey was conducted in English and Spanish.

In 2018, SCRI conducted a similar survey for the counties of the Hudson Valley. In that iteration, respondent data was collected via RDD dual-frame telephone interviews and augmented through the use of the Lucid panel. In 2018, within each county oversamples of residents of the zip codes with the lowest levels of income were included in the unweighted samples.

In both 2018 and 2022, each county estimate was similarly weighted to the most current demographic estimates of the county's population by age, gender, reported race/ethnicity, and income. As such, and despite sampling design differences, the final weighted estimates by county and the final weighted regional estimates from 2018 and 2022 can be fairly compared to one another.

## Major Findings

- $43 \%$ of respondents with $<\$ 25 \mathrm{~K}$ yearly income reported that their ability to afford housing worsened over the course of the COVID-19 pandemic, compared to $23 \%$ of Orange County respondents.
- $37 \%$ of renters in Orange County reported that their ability to obtain affordable, nutritious food worsened over the course of the COVID-19 pandemic, compared to only $20 \%$ of homeowners.
- $33 \%$ of respondents with $<\$ 25 \mathrm{~K}$ yearly income reported being unable to access the internet in the past 12 months, compared to $17 \%$ of Orange County respondents.
- $32 \%$ of respondents with <\$25K yearly income were unable to get transportation when needed it in the previous 12 months, compared to only $17 \%$ of Orange County respondents
- $31 \%$ of Orange County respondents aged 18-34 reported that their mental health has worsened over the course of the COVID-19 pandemic, compared to only $12 \%$ of those aged 55 and older.
- $41 \%$ of Orange County respondents in 2022 reported there are sufficient, quality mental health providers, which is a decrease from 55\% reported in 2018.
- Only 59\% of Orange County respondents aged 18-34 reported having good or excellent mental health, compared to $75 \%$ of Orange County respondents and 85\% of respondents aged 55+.
- $33 \%$ of Orange County respondents with $<\$ 25 \mathrm{~K}$ yearly income reported that in the past 12 months, they or any other member of their household has been unable to get any healthcare including dental or vision compared to $21 \%$ of total Orange County respondents, and 9\% of respondents \$150k+ yearly income.
- $26 \%$ of Orange County respondents aged $18-34$ reported that in the past 12 months, they did not visit primary care physician because they did not have insurance compared to $11 \%$ of respondents aged $55+$.

Additional data can be found: https://orangecountynydoh.shinyapps.io/Siena-Survey/

## Graphs and Tables

## Overview

Forces of Change is a brainstorming session to identify the forces that impact the health of our residents and the local public health system's ability to operate. The Forces of Change Assessment (FOCA) was conducted for the first time at the Public Health Summit held on June 28, 2022. Nearly 90 partners participated in the brainstorming session.

The forces that were discussed included social, economic, political, legal technological, scientific, ethical, and environmental. As each force was discussed, the group tried to identify opportunities and threats that can impact, either now or in the future, the health of our community. We can leverage the opportunities to protect health and ward off the threats.

Forces can be trends, events or elements. Trends are patterns over time. Examples are migration in and out of an area, decrease to inperson work force or increased tele-health visits. Events are one-time occurrences. Examples include COVID pandemic, passage of new legislation, or a power outage due to weather. Discrete elements could be specific factors. Examples include proximity to transportation, a community's ethnic population, or rural setting.

During the session these questions were considered when thinking of what to discuss.

- What is occurring or might occur that affects the health of our community or the local public health system?
- Are there trends occurring that will impact the health of our community?
- What forces are occurring locally? Regionally? Nationally? Globally?
- What may occur in the foreseeable future that may impact our local public health system?
- What specific threats or opportunities are generated by these occurrences
- What may pose a barrier to achieving the shared vision of improving the health of our community?

| Cross Cutting Issues |  |
| :--- | :--- |
| Access to Transportation | Opportunity Themes |
| Equitable access to quality healtheare | Increased Advocacy |
| Access to technologation <br> media | Increased Coordination and Partnership |
| Food deserts and access to healthy and <br> affordable food |  |
| Increasing rates of STls |  |
| Aging population |  |

| SOCIAL AND ECONOMIC FORCES |  |  |
| :---: | :---: | :---: |
| FORCE | THREATS POSED | OPPORTUNITIES CREATED |
| Agency | - Encourage individuals to initiate health and wellness activities on their own behalf | - Increase collective agency to increase <br> - opportunities for health and well-being <br> - Increase opportunities for peer education and community engagement <br> - Empower residents to take control over their health and well-being |
| Aging Population | - Increasing population over 65 <br> - Inadequate housing specific to seniors <br> - Limited in-home and affordable care options | - Promote healthcare careers <br> - Identify needs specific to Seniors <br> - Advocate for insurance reimbursement for non-traditional at home care |
| Antivaccination sentiments | - Decreased vaccination rates <br> - Increase in vaccine preventable illness | - Create information campaigns <br> - Work with providers to increase "catchup" and maintain timely immunizations |
| Childcare Availability | - Increased cost of childcare |  |
| Diversity and social justice | - Differences in access to care and resources based on identity (race, gender, sexuality, religion) <br> - Unequal distribution of resources throughout the County (varies by ZIP Code) <br> - Without access to insurance and primary care some residents are sicker when they do find a source of care |  |

|  | - No longer able to have fundamental conversations and lack of common ground |  |
| :---: | :---: | :---: |
| Food Insecurity | - Food insecurity increased during the pandemic <br> - Federal and State benefits expanded during the pandemic (not all permanent) <br> - Food pantries and meal delivery services overwhelmed during pandemic | - Identify more food resources <br> - Develop system for using "second change" foods from restaurants, food suppliers and grocery stores |
| Healthcare | - Increasing rates of STIs <br> - Gaps in health care <br> - Increased rate of co-pays |  |
| Health Literacy | - Fear of talking with doctors <br> - Understanding prescriptions <br> - Patriarchal health care delivery system set up | - Education for residents <br> - Health detailing of providers and healthcare workers to increase awareness of need for open communication <br> - Patient centered care and treatment plans |
| SOCIAL AND ECONOMIC FORCES |  |  |
| Force | THREATS POSED | OPPORTUNITIES CREATED |
| Housing | - Rental market shrinking <br> - Rental market shifting to short-term rentals (Airbnb) <br> - Lack of affordable housing for all groups (seniors, families, low SES, those in cities) | - Increase advocacy for affordable housing options <br> - Identify alternative housing programs <br> - Increase legislation to ensure housing stock not removed for short term housing |

| Impact to Education System | - Pandemic related delays impacting students' academic achievement <br> - Decreased parent engagement due to multiple jobs and other demands <br> - Use of technology for remote learning <br> - Safety concerns of students being fully remote | - Work with telecommunications partners to ensure wider access to broadband <br> - Use of technology to engage parents <br> - Ensure all students have access to technology for times when remote learning is required |
| :---: | :---: | :---: |
| Isolation | - Pandemic related and seniors in rural areas <br> - Increased drug use, depression and anxiety related to isolation <br> - Lack of transportation |  |
| Safety and Violence | - Increase in crime <br> - Stereotyping of certain populations | - Work with law enforcement <br> - Encourage community conversations |
| Transportation | - Lack of personal transportation <br> - Public transportation routes do not access entire County | - Improve partnerships with transportation agencies <br> - Optimize and expand current transportation routes <br> - Increased funding streams to expand transportation options |
| Workforce Issues | - Shrinking workforce pool <br> - Worker burnout <br> - Lack of funding <br> - Wages for some sectors are not attracting employees <br> - Lack of training for healthcare specific careers <br> - Lack of professional development opportunities | - Partner with local colleges to develop <br> - Education programs <br> - Partner with local schools and colleges <br> - Educate youth about career opportunities |

| FORCE | THREATS POSED | OPPORTUNITIES CREATED |
| :---: | :---: | :---: |
| Climate Change | - Increased prevalence of communicable disease activity (ticks, mosquitos) <br> - Impact to service delivery during natural disasters | - Raise awareness of vector and pathogen activity <br> - Develop emergency response plans |
| Education | - Lack of funding for early childhood education <br> - Ensure adequate education plans if return to virtual learning <br> - Expand health education to include comprehensive education on STIs, drugs, alcohol, vaping, and wellbeing |  |
| Food Deserts | - Increase in food deserts due to pandemic-related closing of businesses <br> - Increased rate of chronic disease and obesity | - Support community gardens <br> - Map transportation routes to supermarkets <br> - Expand access to food benefits at farmers markets |
| Racism | - There is systemic oppression in our community <br> - Disparities in morbidity and mortality rates <br> - Racism impacts many facets of life | - Have community conversations to acknowledge disparities and identify actions for change <br> - Provide sensitivity trainings |
| Sustainability of Resources | - We don't always know what is needed in our community <br> - We have many resources but they are not always known by residents and partners <br> - Ensure partners are aware of resources and are able to refer clients for all services they are in need of | - Ensure that all agencies within the local public health system are aware of who provides what services <br> - Educate staff to know how to access service information to share with residents |
| Taboos Talking About Sex | - Limited access of health partners to youth population <br> - Youth rely on social media to answer questions rather than trusted experts <br> - Youth not comfortable talking about sex and STIs <br> - Fear of talking to doctors | - Work with schools to provide education <br> - Increased services for youth education <br> - Work on improving health literacy of all ages |

| Transportation | - Transportation is a foundational need to ensure access to all services <br> - Public transportation needs to be accessible for seniors, those with disabilities, low SES areas and rural areas <br> - Vital service |
| :---: | :---: |
| Violence | - Unsafe communities <br> - Increased crime <br> - Increased reports of domestic violence due to pandemic <br> - Resources required for those experiencing domestic violence and child support issues |

## POLITICAL AND LEGAL FORCES

| FORCE | THREATS POSED | OPPORTUNITIES CREATED |
| :--- | :--- | :--- |
| Expansion of <br> Government <br> Funding for <br> Healthcare and <br> Social Services | - Potential for return to <br> pre-pandemic <br> coverage | - Advocate for coverage of those <br> in need |
| Legalization of <br> Marijuana <br> Legislation | - Increased drug use <br> - Potential increase in <br> impaired driving | - Increased morbidity <br> and mortality issues <br> associated with <br> increased usage |
| - Mixed perception that <br> marijuana is safe due <br> to legalization | - Work with law enforcement on |  |
| education campaigns |  |  |

TECHNOLOGICAL AND SCIENTIFIC FORCES

| FORCE | THREATS POSED | OPPORTUNITIES CREATED |
| :---: | :---: | :---: |
| Addiction to technology | - Increasing addiction to social media and technology <br> - Isolation due to increased use of technology, social media and gaming <br> - Accessing unreliable health and wellbeing information on social media and the internet <br> - Decreased physical activity due to technology use | - Provide education in K-12 and College communities <br> - Educate on use of settings to limit use and disable notifications <br> - Expand health literacy education to include use of social media and internet information usage |
| Medical advances | - Advances in mRNA vaccine that can be applied to other illnesses <br> - Global collaboration during COVID with applications to other diseases <br> - Rapid changes in understanding during pandemic leading to mistrust of science | - Develop broad networks for communication and education campaigns during crisis |
| Telehealth | - Expanded use of telehealth (particularly with behavioral health) during the pandemic <br> - Increased need for technology access and literacy if using telehealth <br> - Telehealth provides flexibility for those who work or have non-traditional schedules <br> - Increases access for those in rural settings | - Provide educational opportunities to ensure all residents are comfortable with use of technology <br> - Work with community service providers to ensure safety of this technology |

| ETHICAL FORCES |  |  |
| :---: | :---: | :---: |
| FORCE | THREATS POSED | OPPORTUNITIES CREATED |
| Affordable Healthcare | - Knowledge of healthcare access is not always easy to follow <br> - Shift to patient centered care plans that fit the needs of clients <br> - Increasing copays limits use of healthcare <br> - Transportation limits ability to access healthcare | - Continue to find opportunities to share enrollment information <br> - Identify funding streams for additional non- traditional transportation solutions |
| Health <br> Disparities and Cultural Competence | - $O C$ is a diverse community and not all residents feel comfortable accessing services <br> - Information should be shared in appropriate languages and accessible formats |  |
| Housing <br> Affordability and Scarcity | - Lack of affordable housing is decreasing household budgets <br> - Shrinking rental market <br> - Aging population with limited senior specific housing or age in place options | - |
| Livable Wages | - Salaries in the behavioral health field are low and lead to high turn over | - |
| Stigma of Sexual Health Conversations | - STls are increasing and there is stigma surrounding open discussions of sex education <br> - Need to have education campaigns specific to target audiences | - Continue to identify opportunities to educate parents, children, young adults, and other groups <br> - Develop new community partnerships to expand educational opportunities |

There is a need for prioritization from local leaders to address the social determinants of health such as poverty, housing, and transportation and develop strategic opportunities for communities to work together and to build community awareness of these issues.

## PRIORITIZED NEEDS SPECIFIC TO MONTEFIORE ST. LUKE'S CORNWALL

## Health Disparities and Inequities to be Addressed/Targeted

After reviewing the collective findings of each of the data sources, the following conclusions and identification of health inequities have been identified. Of note, this is a summary of inequities revealed during a thorough analysis of local, regional and internal data. The analysis stratified of data included the review of the Orange County Community Health Assessment, the Mid-Hudson Region Community Health Assessment, as well as Montefiore St. Luke's Cornwall specific data.

Health Condition/Outcome Metric

## Description of Inequity

| Colorectal Cancer | Orange County has the highest incidence rate in the non-Hispanic black population in the region (seven counties). ${ }^{1}$ |
| :---: | :---: |
|  | Mortality rates are increased in the non-Hispanic black \& Asian/Pacific Islander populations in Orange County. ${ }^{2}$ |
|  | Orange County has one of the lowest colorectal cancer screening rates for adults aged 50-64 in the region. ${ }^{1}$ |
| Breast Cancer | Late-Stage breast cancer incidence rates for non-Hispanic black population is increased in NYS and Orange County. ${ }^{2}$ |
|  | Increased breast cancer mortality rate for non-Hispanic black population in NYS \& Orange County. ${ }^{2}$ |
| Diabetes | Increased rates of hospitalizations in the non-Hispanic black population in NYS \& Orange County. ${ }^{2}$ |
|  | Increased diabetes mortality in non-Hispanic black population in NYS \& Orange County. ${ }^{2}$ |
| Stroke | Increased rates of hospitalizations for stroke in non-Hispanic black population in NYS \& Orange County. ${ }^{1}$ |
|  | Increased mortality rate in the non-Hispanic black population in NYS \& Orange County. ${ }^{1}$ |
| Maternal Health | In NYS, black women are three times more likely to die from pregnancy-related complications than white women. ${ }^{2}$ |
|  | Orange County has $2^{\text {nd }}$ lowest rate of births with prenatal care in the $1^{\text {st }}$ trimester in the region in the non-Hispanic black population. ${ }^{2}$ |
| Infant Health | The percentage of premature non-Hispanic Black births, low birth weight, and infant mortality in Orange County far exceeds every other race and is also higher than the state rate for non-Hispanic Black. ${ }^{2}$ |

## Colorectal Cancer

## Health Inequity

Colorectal Incidence \& Mortality Rate in Non-Hispanic Black Population

## Data Analysis:

The age-adjusted colorectal cancer incidence rate in the non-Hispanic black population is the highest in the Mid-Hudson (seven county) Region. (See Figure 228)
Orange County has one of the lowest colorectal cancer screening rates for adults aged 50-64 in the region. (See Figure 229)
Colorectal cancer mortality is higher in the non-Hispanic Black population, compared to the non-Hispanic White and Hispanic populations. (See Figure 57)

Figure 228
Age-Adjusted Colorectal Cancer Incidence Rate per 100,000 by Race/Ethnicity, 2016-2018

*. The rate or percertoge is unstatle.
E Dato are auppressed. The data do not meet the criteria for contidentality.
Note. Morfolity rates atratified by roce/ethnidity are not ahown dive to suppressed and/or unstoble date in most counties.

Diabetes Hospitalization and Mortality Rate in non-Hispanic Black

## Data Analysis:

Non-Hispanic Black populations had the highest hospitalization rate at 28.8 (See Figure 42).
The rate of diabetes mortality increases with age, and just as with diabetes hospitalizations, non-Hispanic Black populations faced the highest diabetes mortality rate in both the county and NYS excl. NYC when compared to other racial/ethnic groups (See Figure 44).

## Cerebrovascular Disease (Stroke)

## Health Inequity

Hospitalization \& Mortality Rates for Stroke in Non-Hispanic Black Population

## Definition of Disparity

When adjusting for age, non-Hispanic Black populations had higher rates of stroke hospitalization (27.9 per 10,000) compared to other racial/ethnic groups in the county (See Figure 38).
Stroke mortality rate was highest in the non-Hispanic Black population in the county according to the Mid-Hudson Region assessment, however, the Orange County assessment states that the highest mortality rate is in the non-Hispanic White population (See Figures 40 \& 199).

Source: Mid-Hudson Region Community Health Needs Assessment 2022-2024

[^20]Rates are calculated using ACS 5-year population estimates except for the age intervals <1 and 1-9, which are based off of crude live

NYSDOH County Health Indicators by Race/Ethnicity (CHIRE)

In order to avoid the consequences of uncontrolled diabetes, there are many adults who get their blood sugar tested by their medical provider. In 2016, the percentage of those who had a test for high blood sugar or diabetes within the past three years, was very similar across the Mid-Hudson Region, as well as New York State and New York State excluding New York City [see Figure 209174].

Figure 209

When stratifying data by race/ethnicity, diabetes mortality rates were highest among the non-Hispanic Black population in New York State, as well as New York State excluding New York City, and most of the counties in the Mid-Hudson Region. However, in Putnam County, Hispanic adults had the highest mortality rate [22.4 per 10,000 population). In addition, non-Hispanic White adults had the highest mortality rate in Ulster County ( $18.1 \%$ ) [see Figure 212177).

## Cirrhosis of the Liver

Cirrhosis is a condition in which the liver experiences fibrosis (scarring) that can lead to permanent damage. In the U.S., it is included in the top ten leading causes of death. Causes of cirrhosis include (but are not limited to) chronic alcohol abuse, viral hepatitis (more commonly hepatitis B and C), and fatty liver disease. Symptoms also include fatigue, bleeding, edema (swelling) in lower extremities, and hepatic encephalopathy (loss of brain function due to the liver's inability to remove toxins from the blood).

From 2016-2019, mortality from cirrhosis of the liver averaged at 8.1 deaths per 100,000 population. Mortality rates increase with age and are higher among males and the non-Hispanic White population in the county [see Table 25, Figure 46]. Discharge rates for cirrhosis of the liver were also higher among males than females in the county, which follows the trend seen at the state level (excl. NYC) [see Table 26].

Age-adjusted cirrhosis mortality in Orange County started to decrease in 2013, but in 2015, it started increasing again, reaching a high of 7.5 per 100,000 in 2018. This increase beginning in 2015 is also seen at the state level, though the rates for Orange County have remained below those of the state over time [see Figure 45].

[^21]When stratifying this data by race/ethnicity, the rates differ in most of the counties. Like New York State and New York State excluding New York City, Orange, Ulster, and Westchester Counties' highest rates of colorectal cancer incidence were among the non-Hispanic Black population. Non-Hispanic White populations had the highest rates of Colorectal Cancer in Dutchess, Rockland, and Sullivan Counties [see Figure 228].

hmps://www/healthny.gov/statistics/community/minority/county/county list hatm

The US Preventive Services Task Force recommends that adults aged $50-75$ years receive screening for colorectal cancer. Some screening tests include colonoscopy; guaiac-based fecal occult blood test (gFOBT), which uses a chemical called guaiac to detect blood in the stool; or a fecal immunochemical test (FIT), which uses antibodies to look for blood in the stool. ${ }^{14}$

The New York State Prevention Agenda aims to have the percentage of adults who receive a colorectal cancer screening based on recent guidelines aged $50-64$ years to be $66.3 \%$. The Mid-Hudson Region fell below this target, with $64.1 \%$ of adults aged $50-64$ years receiving a colorectal cancer screening test based on the most recent guidelines in 2018 [see Figure 229]. Putnam, Ulster, and Westchester Counties were the counties in the region that met or exceeded the Prevention Agenda target.

Original Data Source: Cancer Registry Data, Updated as of 2020

Orange County has a colorectal cancer mortality rate of 17 per 100,000, higher than the NYS rate of 12.1. When looking over time, colon and rectum cancer mortality rates have decreased for NY State. However, Orange County's mortality rates appear to fluctuate annually, decreasing one year and increasing the next. This pattern continued until 2016, where colon and rectum cancer mortality rate began to steadily increase, reaching its highest point yet in 2017, at 17.0 per 100,000 [see Figure 57, Figure 58].

Figure 57

## LUNG CANCER

Lung cancer is the primary cause of cancer deaths, for both males and females, in all of the Mid-Hudson Region and New York State. Some symptoms of lung cancer include chest pain, coughing (sometimes with blood), shortness of breath, and/or wheezing. The leading risk factor for lung cancer is tobacco use. According to the NYSDOH, smoking is responsible for over $80 \%$ of lung cancers. ${ }^{185}$ Another risk factor for lung cancer is radon exposure. Radon is a colorless, radioactive gas that comes from the decay of elements such as uranium, which is found in soil and rock. ${ }^{130}$ Radon is in the surrounding air, so it is not possible to completely avoid it. However, preventive measures can be taken to lower exposure, such as utilization of radon detection kits in the home or office.

From 2015-2019, the highest rates of lung cancer incidence were in Putnam, Sullivan, and Ulster Counties (66.6, 65.0 , and 64.6 per 100,000 population, respectively), which was higher than New York State but consistent with New York State excluding New York City ( 57.6 and 65.1 per 100,000 population, respectively) [see Figure 230195].

The Healthy People 2020 goal was to reduce lung cancer mortality to 45.5 deaths per 100,000 population. All of the counties in the Mid-Hudson Region, as well as New York State and New York State excluding New York City, met this target [see Figure 230195].

When stratifying data by race/ethnicity, non-Hispanic Black adults had higher rates of stroke hospitalization compared to other racial/ethnic groups in the majority of the counties in the Mid-Hudson Region, New York State, and New York State excluding New York City. This excludes Putnam County, where Hispanic adults had the highest hospitalization rates [see Figure 196161].

Figure 196
Age-Adjusted Cerebrovascular Disease (Stroke) Hospitalization Rate per 10,000 by Race/Ethnicity, 2017-2019

Note: The 2019 ED data in New York City may be incomplete and subject to change. Thus, the state rate may be underestimated and subject to change.
Source: NYSDOH County Health Indicators by Race/Ethnicity (CHIRE), 2021
https://www.health.ny.gov/statistics/community/minority/county/county list.htm

When stratifying this data by race/ethnicity, the rates differ among each county. The majority of the counties in the Mid-Hudson Region had a higher rate of non-Hispanic Black adults who died from a stroke. Putnam County is an exception with the Hispanic adult population having a higher rate of stroke mortality, though the rate is statistically unstable [see Figure 199].

Figure 199
Age-Adjusted Cerebrovascular Disease (Stroke) Mortality Rate per 100,000 by Race/Ethnicity, 2017-2019

PREVENTABLE HEART FAILURE

Among the counties in the Mid-Hudson Region, potentially preventable heart failure hospitalization rates have only seen marginal variation in recent years-with Dutchess, Rockland, and Ulster counties experiencing slight increases and Orange, Putnam, Sullivan, and Westchester experiencing slight decreases. At the state level, overall slight increases in rates were seen from 2017-2019 [see Figure 200].

Figure 63
Age-Adjusted Breast Cancer Late-Stage Incidence per 100,000 Female Population by Race/Ethnicity, 2016-2018

Breast cancer mortality (age-adjusted) has been rising in Orange County since 2013 and has surpassed that of NYS, climbing from a rate of 18.6 per 100,000 female population in 2013 to 26.0 in 2017 [see Figure 64. Similar to breast cancer incidence, there are disparities in breast cancer mortality by race/ethnicity. NonHispanic Black women face the highest rate of breast cancer mortality, at 50.4 per 100,000 female population, double the rate for non-Hispanic Whites. The Asian/Pacific Islander rate is also disproportionately high at 39.2 per 100,000 [see Figure 65].

## MATERNAL HEALTH

Maternal mortality refers to the death of a person while they are pregnant, in delivery, or soon after giving birth. Maternal mortality and morbidity are key indicators of the overall health of a society. In the U.S., maternal mortality rates have doubled in the past decade, and these deaths are plagued with racial and ethnic disparities. In NYS in particular, black women are three times more likely to die from pregnancy-related complications than white women. ${ }^{2 s}$ In Orange County, the rates of maternal mortality have steeply increased from 2014 onward, reaching a rate of 39.1 per 100,000 live births in 2018. This rate far exceeds the PA 2024 goal of 16 per 100,000. [see Figure 75].

Figure 75

## PRENATAL CARE

Prenatal care is the health care received from medical providers during pregnancy, including checkups, physicals, and prenatal testing. Getting early and regular prenatal care in the first trimester can help keep mothers and their babies healthy, as it lets medical providers identify and treat health problems early. Of the mothers who do not get prenatal care, their babies are three times more likely to have a low birth weight and five times more likely to die. ${ }^{27}$

From 2016-2019, an average of $69.1 \%$ of births in Orange County had early (first trimester) prenatal care. There were disparities in prenatal care by age of the mother, and race/ethnicity. Births given to younger

[^23]There are racial and ethnic disparities surrounding prenatal care in the Mid-Hudson Region. Non-Hispanic White women had the highest percentage of early prenatal care in every county. Non-Hispanic Black and Hispanic women had slightly lower percentages of early prenatal care [see Figure 278].

## ALL PREGNANCIES BY AGE GROUP

Among women aged 15-44 years, the pregnancy rate in the Mid-Hudson Region was 78.1 per 1,000 females, which was lower than New York State ( 79.7 per 1,000 females). Rockland County had the highest pregnancy rate (104 per 1,000 females), followed by Sullivan County and Orange County ( 92.9 and 92.4 per 1,000 females respectively). The lowest pregnancy rate was in Putnam County ( 55.1 per 1,000 females). [See Figure 279].

The Impact of Health Issues in Orange County ( $\mathrm{n}=45$ )

Addressing how MSLC can best reach the African American population in our communities will be a primary focus of our Prevention Agenda efforts throughout 2022-2024, specifically in the areas of increasing cancer screening rates, diabetes education, and engaging patients in accessing maternal and infant health services.

## Implementation Plan

Montefiore St. Luke's Cornwall, in partnership with the Orange County Department of Health and our community partners, will work collaboratively to address the identified Community Health Needs as outlined in this document. MSLC's implementation strategy is developed in partnership with the following: OC Department of Health, with Bon Secours Hospital, Garnet Health Medical Center, Montefiore St. Luke's Cornwall Hospital, St. Anthony Community Hospital, and with the support of almost 100 other community organizations. The collective efforts are spearheaded by the Orange County Department of Health, with quarterly date recopied

The New York State Public Health and Health Planning Council's Ad Hoc Committee to Lead the Prevention Agenda created the Prevention Agenda Health Improvement Plan for 2019-2024. The Prevention Agenda establishes priority areas, goals for each priority area and defines indicators to measure progress toward achieving these goals, including reductions in health disparities among racial, ethnic, and socioeconomic groups and persons with disabilities. The five Prevention Agenda priority areas are:

- Prevent Chronic Diseases
- Promote a Healthy and Safe Environment
- Promote Healthy Women, Infants, and Children
- Promote Well-Being and Prevent Mental Health and Substance Use Disorders
- Prevent Communicable Diseases

As part of the required update to the CHIP, NYSDOH requires all health departments and hospitals to choose two priority areas and address at least one health disparity in their communities. To make significant strides towards improving the health of county residents, the priority areas, goals, and strategies are chosen collaboratively between OCDOH, Montefiore St. Luke's Cornwall, Bon Secours Hospital, Garnet Health Medical Center, and St. Anthony Community Hospital.

Orange County utilized a modified Mobilizing for Action through Planning and Partnerships (MAPP) strategic planning process with community partners and residents to determine the CHIP priorities. The MAPP process uses four unique assessments to determine community priorities: Community Themes and Strengths, Community Health Status, Forces of Change, and Local Public Health System Assessment. Orange County conducted three of the four assessments and will complete a comprehensive Local Public Health System Assessment in the future.

MSLC among many other community partners were engaged in several assessments and strategic planning activities. The Orange County Health Summit was held on June 28th, 2022 with approximately 100 partners including hospitals, health care providers, community-based organizations, and academia to review the most the current state of health in Orange County; identify and discuss the forces that impact the health of residents; provide input on the next two Prevention Agenda Priorities for the 2022-2024 CHIP; and participate in breakout groups to discuss current efforts, assets, and barriers in each of the five priority areas. This year's theme "A Collaborative Approach to Community Health Planning" emphasized the need to engage all segments of the community to improve health outcomes together.

An overview of the most recently available data was provided to participants covering:

- Secondary data in each of the five NYSDOH Prevention Agenda areas
- Preliminary findings of the Community Asset Survey
- Data from the 2022 Provider Survey and focus groups with local human service providers
- Health rankings utilizing the Modified Hanlon Method which utilizes objective data measures to prioritize health problems

A provider survey and subsequent focus groups were conducted in May and June 2022, in partnership with the Joint Membership of Health and Community Agencies (JMHCA) and Changing the Addition Treatment Ecosystem, to collect data on underrepresented populations, including low-income, veterans, persons experiencing homelessness, the aging population, LGBTQ community, and people with a mental health diagnosis or those with a substance use disorder. Community engagement participation was completed though the Community Asset Survey, Priority Rock Voting, Listening Sessions, and the Mid-Hudson Regional Community Health Survey. The MidHudson Regional Community Health Survey and Larger Health Assessment were completed in conjunction with the six other Mid-Hudson County Health Departments and area hospitals in 2022. Priority areas were then selected utilizing data from the Regional and Community Health Status Assessments, Orange County Health Summit participant selections, and results from the aforementioned community survey tools.

The two overarching priority areas chosen were Prevent Chronic Disease and Promote Well-Being and Prevent Mental Health and Substance Use Disorders. Within each of the priorities' strategic plan, the reduction of health disparities will be addressed through the concentration of efforts in areas of the largest economic needs and in areas with minority majorities. Additional upstream contributors to the priority areas will also be addressed such as health insurance access, transportation barriers, increased connection with primary care providers, food instability, and advocacy around affordable housing.

Within the priority area of Prevent Chronic Disease, the following focus areas and goals were chosen (numbers corresponding to the New York State Prevention Agenda):

## Focus Area 1: Healthy Eating and Food Security

Goal 1.1 Increase access to healthy and affordable foods and beverages Goal 1.3 Increase food security **MSLC will specifically focus on Goal 1.3 only ${ }^{* * *}$

## Focus Area 4: Preventative Care and Management

Goal 4.1 Increase cancer screening rates for breast, cervical and colorectal cancer
Within the priority area of Promote Well-Being and Prevent Mental Health and Substance Use Disorders, the following focus areas and goals were chosen (numbers corresponding to the New York State Prevention Agenda):

## Focus Area 2: Mental and Substance Use Disorders Prevention

Goal 2.2. Prevent Opioid and other Substance Misuse and Deaths
${ }^{* *}$ MSLC will take a lead role on the implementation efforts of this goal**

## Partner Engagement:

As identified by the Orange County Department of Health, MSLC, will work collaboratively with our fellow hospitals in the region, as well as the Department of Health to ensure that the above outlined strategies are being properly implemented and tracked. The workgroups will report out quarterly amongst their individual groups, and then annually at the Orange County Health Summit. MSLC Clinical Leadership, inclusive of our Chief Nursing Officer, Assistant Vice President of Quality Management, Community Engagement teams, Case Managers and additional member of Patient Care Leadership throughout the organization will be responsible for collectively ensuring the elements of the 2022-2024 Community Health Improvement Plan are met.

Partner engagement will be maintained through consistent communication and accountability at each level. Further, as referenced by the Orange County Department of Health, "OCDOH and the participating hospitals have strong community partnerships with hundreds of organizations serving its residents, including federally qualified health care centers, private medical providers, local two-year and four-year colleges, a medical school, community-based organizations, and other organizations serving a broad variety of community needs including transportation, food security, housing, and economic stability. OCDOH has established multiple coalitions including Healthy Orange, the Maternal and Infant Community Health Collaborative, and the Orange County Cancer Screening Collaborative. OCDOH also co- leads and participates in many countywide coalitions, such as Changing the Orange County Addiction Treatment Ecosystem, Healing Communities Study Steering Committee and Workgroups, WELCOME Orange, and the Resilience Project. These coalition partners will also be mobilized to address the health areas of focus and emerging issues for the 2022-2024 CHIP cycle. Additionally, community members can contact each of the focus group leaders to become involved."

On behalf of all of us at Montefiore St Luke's Cornwall, thank you for taking the time to read this document.

Date Report is Made Available to the Public: The 2022 Community Health Assessment will be submitted on December 30, 2022, and will be posted on the hospital's website: www.Montefioreslc.org/community/

The MSLC Governing Board Adopted this Plan on Wednesday, November 30, 2022

| Potentially preventable heart failure hospitalization rate per 10,000 population - Aged 18 years and older (2017-2018) | 35.9 | 41.6 | 9.9 | 13.8 | 36.0 |
| Diabetes Indicators |  |  |  |  |  |
| Diabetes mortality per 100,000 population, age-adjusted | 14.5 | 30.0 | 20.4* | 20.7 | 16.2 |
| Diabetes (primary diagnosis) hospitalizations per 10,000 population, age-adjusted | 12.8 | 28.8 | 5.1 | 14.3 | 16.8 |
| Diabetes (any diagnosis) hospitalizations per 10,000 population, age-adjusted | 179.7 | 298.2 | 87.5 | 199.3 | 222.6 |
| Potentially preventable diabetes short-term complications hospitalization rate per 10,000 population - Aged 18+ Years | 4.6 | 9.1 | s | 4.2 | 6.0 |
| Cancer Indicators |  |  |  |  |  |
| Lung cancer incidence per 100,000 population, age-adjusted (2016-2018) | 69.8 | 48.6 | 32.6* | 32.9 | 62.7 |
| Colorectal cancer mortality per 100,000 population, age-adjusted (2016-2018) | 15.4 | 33.2 | 40.9 | 13.6 | 17.0 |
| Colorectal cancer incidence per 100,000 population, age-adjusted (2016-2018) | 39.6 | 57.9 | 28.3 | 32.0 | 40.0 |
| Female breast cancer mortality per 100,000 female population, age-adjusted (2016-2018) | 24.5 | 50.4 | 39.2* | 14.7 | 26.0 |
| Female late stage breast cancer incidence per 100,000 female population, age-adjusted (2016-2018) | 46.0 | 59.2 | S | 37.2 | 45.7 |
| Cervix uteri cancer mortality per 100,000 female population, age-adjusted (2016-2018) | 2.9 | S | S | S | 3.3 |
| Cervical cancer incidence per 100,000 female population, age-adjusted (2016-2018) | 9.6 | 13.2* | S | 13.2 | 10.8 |

Data are suppressed. The data do not meet the criteria for confidentiality.
White non-Hispanic, Black (including Hispanic), Asian (including Hispanic, excluding Pacific Islanders), and Hispanic.
Data do not meet the criteria for statistical reliability or data quality, or data not available.
APNCU: Adequacy of Prenatal Care Utilization Index.
In 2015, SPARCS transitioned from ICD-9-CM to ICD-10-CM diagnosis codes. These two are not comparable, so ED and hospitalization data for 2016-and-forward should not be compared with earlier data.
The 2018 population estimates are also used to calculate rates for 2019 and 2020.

## County Health <br> Rankings \& Roadmaps

Building a Culture of Health, County by County

## 2022 State Report New York

## 2022 County Health Rankings for the 62 Ranked Counties in New York

For more information on how these ranks are calculated, view the technical notes at the end of this report and visit www.countyhealthrankings.org

County Health Rankings \& Roadmaps (CHR\&R) brings actionable data, evidence, guidance, and stories to diverse leaders and residents so people and communities can be healthier. The University of Wisconsin Population Health Institute created CHR\&R for communities across the nation, with funding from the Robert Wood Johnson Foundation.

## What are the County Health Rankings?

The Rankings help us understand what influences how long and how well we live. They provide measures of the current overall health (health outcomes) of each county in all 50 states and the District of Columbia. Rankings data include a variety of measures, such as high school graduation rates, access to nutritious foods, and the percent of children living in poverty, all of which impact the future health of communities (health factors).

We believe in a future where everyone has opportunities to be healthy and to thrive. Many factors impact how long and how well we live. Our data show how these factors shape community conditions, while highlighting the stark differences in health that stem from injustices and barriers to opportunity. Use our resources to take action toward better health for all.

Communities use the Rankings to build support for local health improvement initiatives by engaging many sectors including public health, health care, business, policymakers, and local residents.

## The County Health Rankings Model

The County Health Rankings Model illustrates a broad vision for health. The model shows that policies and programs at the local, state, and federal levels play an important role in shaping health factors that in turn, influence a community's health outcomes.

Health factors represent things that, if modified, can improve length and quality of life. They are predictors of how healthy our communities can be in the future. The four health factor areas in the model include Health Behaviors, Clinical Care, Social \& Economic Factors, and Physical Environment.

Health outcomes represent how healthy a county is right now. They reflect the physical and mental well-being of residents through measures representing the length and quality of life typically experienced in the community.

## Growing Healthy Places Means Ensuring Opportunities for All

Communities thrive when all people can be healthy in their neighborhoods, schools, and workplaces. CHR\&R brings actionable data and strategies to communities working to ensure that healthy places are available to all. Pages 5 and 6 of this report highlight how health outcomes and health factors differ by place within New York. On page 7, we outline how economic security - or the ability of individuals, households, and communities to meet basic needs with dignity - is important to health. We call attention to childcare cost burden as a barrier to economic security and health.

## Growing Community Power to Improve Health Equity

The Take Action to Improve Health section of the CHR\&R website helps communities find tools and guidance to take action, select evidence-informed strategies, and make lasting changes. Take Action to Improve Health is a hub for information to help improve a community's health and foster health equity. Find resources including:

- What Works for Health, a searchable menu of evidence-informed strategies.
- Action Learning Guides, self-directed learning modules that combine guidance, tools, and reflection activities.

## Using Data to Improve Health Equity

Data show a persistent pattern across the country in barriers to opportunity for people with lower incomes and for people of color. Differences in the opportunities available to different groups of people are related to unfair policies and practices.

Our progress toward health equity will be measured by how health disparities change over time. Visit www.countyhealthrankings.org to learn more about:

1. Health outcome and factor measures for your state and county.
2. Measures with data available by race and ethnicity to illuminate differences in opportunities for health.
3. Additional data resources for New York that provide information about health and opportunity by age group, gender, and zip code.

## What Has Been Done Can Be Undone

Achieving health equity means eliminating unjust and avoidable differences in access and opportunity. What can communities do to tackle unfair differences in how long and how well people live? Check out new strategies at What Works for Health that can address past harms and create conditions for thriving communities for everyone.

Many communities are mobilizing to harness the collective power of residents, organizations, and policymakers. They are working together to address past and present policies that cause harm and are ensuring the growth of healthy places for all. To learn about these efforts, visit countyhealthrankings.org.

## What are Health Outcomes?

We measure length and quality of life to understand the health outcomes among counties in New York.

## Length of Life

Premature death
(years of potential life lost
before age 75)

## How Do Counties Rank for Health Outcomes?

The green map shows New York's health outcome rankings by county. The map is divided into four quartiles with less color intensity indicating better health outcomes. Specific county ranks can be found in the table on page 2.

Detailed information on the measures and their associated weights is available toward the end of this report. Learn about how we calculate health outcome ranks at www.countyhealthrankings.org.

## Quality of Life

Self-reported health status

Percent of low birthweight newborns

## What Do Differences Between Ranks Mean?

Counties are ordered by the health outcome rank, with a top-ranked county (rank =1) having the best health outcome score. Ranks are good for sparking conversations, but they do not show differences in health within counties or describe the magnitude of difference in community health experienced between ranks. The chart next to the map shows the spread of health outcome scores (ranks) for each county (green circles) in New York. This graphic shows the size of the gaps between ranked counties. The background colors correspond to the map legend.

Figure 1. Health outcome ranks displayed using quartiles (map) and underlying health outcome scores (chart)

## What are Health Factors?

Health factors represent community conditions that we can change to improve health and opportunity, such as access to quality education, living wage jobs, quality clinical care, nutritious foods, green spaces, and secure and affordable housing. We measure four health factor areas.

| Health Behaviors | Clinical Care |
| :---: | :---: |
| Tobacco use |  |
| Diet \& exercise | Access to care |
| Alcohol \& drug use | Quality of care |
| Sexual activity |  |

## How Do Counties Rank for Health Factors?

The blue map shows New York's health factor rankings by county. The map is divided into four quartiles with less color intensity indicating better health factors. Specific county ranks can be found in the table on page 2.

Detailed information on the measures and their associated weights is available toward the end of this report. You can also learn about how we calculate health factor ranks at www.countyhealthrankings.org.

Figure 2. Health factor ranks displayed using quartiles (map) and underlying health factor scores (chart)

## Economic Security is Key to Thriving Communities

Economic security enables families to cover basic needs such as housing, education, childcare, food, and medical care. Each of these needs has demonstrated ties to health. However, economic security is not equally accessible to all people. When a single household expense consumes the majority of a paycheck, it becomes difficult to meet competing needs and can force households into tough decisions like choosing between quality childcare, paying rent, and purchasing nutritious food. Individuals, households, and communities deserve the opportunity to meet basic needs with dignity. Advancing a just recovery from the COVID-19 pandemic, and the layered impacts of racism and economic exclusion requires intentional action to ensure all people and places have what they need to thrive. Check out policies and programs that can be implemented in your community at What Works for Health.

## Childcare Cost Burden in New York and the U.S.

Childcare cost burden measures the percentage of household income needed to pay for childcare. When childcare is affordable and accessible, it can support parents' and guardians' ability to participate in paid work and can provide lifelong benefits to children. The U.S. Department of Health and Human Services' benchmark suggests childcare is no longer affordable if it exceeds $7 \%$ of a household's income. This measure of childcare cost burden reflects the experience of a household with two children.

## Childcare Cost Burden in New York Counties

The childcare cost burden among counties in New York ranges from 24\% to 48\%.

## In Context

- Similar levels of childcare cost burden exist across all levels of urbanization.
- Median household income varies by race and ethnicity across New York counties ranging between \$44,268 for American Indian \& Alaska Native households to \$81,033 for white households. These income disparities demonstrate how economic security is not equally accessible to all people living in New York.

Figure 3. Childcare cost burden in New York by county

## Childcare Cost Burden Across the U.S.

The typical cost burden of childcare among counties in the U.S. is about $25 \%$ of household income - meaning a quarter of every dollar earned goes to paying for childcare. Families in every state experience a childcare cost higher than the 7\% federal benchmark of affordability. The childcare cost burden in New York is 30\%.

Figure 4. Childcare cost burden in the U.S. by state

## 2022 County Health Rankings: National and New York State Values for Ranked Measures

| Measure | Description | US | NY | NY Minimum | NY <br> Maximum |
| :---: | :---: | :---: | :---: | :---: | :---: |
| HEALTH OUTCOMES |  |  |  |  |  |
| Premature death* | Years of potential life lost before age 75 per 100,000 population (age-adjusted). | 7,300 | 6,000 | 4,400 | 8,700 |
| Poor or fair health | Percentage of adults reporting fair or poor health (age-adjusted). | 17\% | 16\% | 13\% | 30\% |
| Poor physical health days | Average number of physically unhealthy days reported in past 30 days (age-adjusted). | 3.9 | 3.6 | 3.1 | 4.9 |
| Poor mental health days | Average number of mentally unhealthy days reported in past 30 days (age-adjusted). | 4.5 | 3.9 | 3.8 | 5.2 |
| Low birthweight* | Percentage of live births with low birthweight (<2,500 grams). | 8\% | 8\% | 4\% | 10\% |
| HEALTH FACTORS |  |  |  |  |  |
| HEALTH BEHAVIORS |  |  |  |  |  |
| Adult smoking | Percentage of adults who are current smokers (age-adjusted). | 16\% | 13\% | 11\% | 23\% |
| Adult obesity | Percentage of the adult population (age 18 and older) that reports a body mass index (BMI) greater than or equal to $30 \mathrm{~kg} / \mathrm{m}^{2}$ (age-adjusted). | 32\% | 27\% | 22\% | 39\% |
| Food environment index | Index of factors that contribute to a healthy food environment, from 0 (worst) to 10 (best). | 7.8 | 9.0 | 6.2 | 9.9 |
| Physical inactivity | Percentage of adults age 18 and over reporting no leisure-time physical activity (ageadjusted). | 26\% | 27\% | 22\% | 39\% |
| Access to exercise opportunities | Percentage of population with adequate access to locations for physical activity. | 80\% | 88\% | 14\% | 100\% |
| Excessive drinking | Percentage of adults reporting binge or heavy drinking (age-adjusted). | 20\% | 19\% | 16\% | 24\% |
| Alcohol-impaired driving deaths | Percentage of driving deaths with alcohol involvement. | 27\% | 20\% | 0\% | 56\% |
| Sexually transmitted infections | Number of newly diagnosed chlamydia cases per 100,000 population. | 551.0 | 640.6 | 144.5 | 1,289.0 |
| Teen births* | Number of births per 1,000 female population ages 15-19. | 19 | 13 | 3 | 34 |
| CLINICAL CARE |  |  |  |  |  |
| Uninsured | Percentage of population under age 65 without health insurance. | 11\% | 6\% | 4\% | 10\% |
| Primary care physicians | Ratio of population to primary care physicians. | 1,310:1 | 1,180:1 | 13,450:1 | 700:1 |
| Dentists | Ratio of population to dentists. | 1,400:1 | 1,190:1 | 5,320:1 | 540:1 |
| Mental health providers | Ratio of population to mental health providers. | 350:1 | 310:1 | 1,540:1 | 100:1 |
| Preventable hospital stays* | Rate of hospital stays for ambulatory-care sensitive conditions per 100,000 Medicare enrollees. | 3,767 | 3,717 | 2,649 | 6,024 |
| Mammography screening* | Percentage of female Medicare enrollees ages 65-74 that received an annual mammography screening. | 43\% | 43\% | 34\% | 55\% |
| Flu vaccinations* | Percentage of fee-for-service (FFS) Medicare enrollees that had an annual flu vaccination. | 48\% | 49\% | 38\% | 56\% |
| SOCIAL \& ECONOMIC FACTORS |  |  |  |  |  |
| High school completion | Percentage of adults ages 25 and over with a high school diploma or equivalent. | 89\% | 87\% | 73\% | 94\% |
| Some college | Percentage of adults ages 25-44 with some post-secondary education. | 67\% | 70\% | 50\% | 85\% |
| Unemployment | Percentage of population ages 16 and older unemployed but seeking work. | 8.1\% | 10.0\% | 6.2\% | 16.0\% |
| Children in poverty* | Percentage of people under age 18 in poverty. | 16\% | 17\% | 6\% | 31\% |
| Income inequality | Ratio of household income at the 80th percentile to income at the 20th percentile. | 4.9 | 5.7 | 3.6 | 9.1 |
| Children in single-parent households | Percentage of children that live in a household headed by a single parent. | 25\% | 26\% | 11\% | 50\% |
| Social associations | Number of membership associations per 10,000 population. | 9.2 | 8.1 | 2.8 | 17.0 |
| Violent crime | Number of reported violent crime offenses per 100,000 population. | 386 | 379 | 48 | 598 |
| Injury deaths* | Number of deaths due to injury per 100,000 population. | 76 | 53 | 37 | 97 |
| PHYSICAL ENVIRONMENT |  |  |  |  |  |
| Air pollution - particulate matter | Average daily density of fine particulate matter in micrograms per cubic meter (PM2.5). | 7.5 | 6.9 | 3.4 | 10.4 |
| Drinking water violations ${ }^{+}$ | Indicator of the presence of health-related drinking water violations. 'Yes' indicates the presence of a violation, 'No' indicates no violation. | N/A | N/A | N/A | N/A |
| Severe housing problems | Percentage of households with at least 1 of 4 housing problems: overcrowding, high housing costs, lack of kitchen facilities, or lack of plumbing facilities. | 17\% | 23\% | 10\% | 39\% |
| Driving alone to work* | Percentage of the workforce that drives alone to work. | 75\% | 52\% | 6\% | 83\% |
| Long commute - driving alone | Among workers who commute in their car alone, the percentage that commute more than 30 minutes. | 37\% | 39\% | 15\% | 68\% |

*Indicates subgroup data by race and ethnicity is available; +Not available in all states

## Glossary of Terms, Technical Notes, and FAQs

## Glossary of Terms

Health equity: Assurance of conditions for optimal health for all people. Achieving health equity requires valuing all individuals and populations equally, recognizing and rectifying historical injustice, and providing resources according to need.
Health inequity: Differences in health factors or outcomes that are systematic, avoidable, unnecessary, unfair, and unjust. Health disparities: The numerical or statistical differences in health outcomes, such as mortality rate differences. Reducing and ultimately eliminating disparities in health and its determinants of health is how we measure progress toward health equity.

## Technical Notes

- Figures 1 and 2 depict each county as a single, semi-transparent circle. Counties with very similar values are displayed as overlapping circles having greater color saturation. Similarly, circles representing states may be overlapping in Figure 4.
- The state and national values for childcare cost burden represent the median of counties within the state and nation, respectively.

## FAQs

How does CHR\&R select evidence-informed solutions?
Evidence-informed solutions are supported by robust studies or reflect recommendations made by experts. To learn more about our evidence analysis methods, visit What Works for Health.

How does CHR\&R rank counties?
To calculate the ranks, we first standardize each of the measures using z-scores. Z-scores allow us to combine multiple measures because the measures are now on the same scale. The ranks are then calculated based on weighted sums of the measure $z$-scores within each state to create an aggregate $z$-score. The county with the best aggregate $z$-score (healthiest) gets a rank of \#1 for that state. The aggregate $z$-scores are graphed next to the maps for health outcomes and health factors on pages 5 and 6 to show the distribution of the values that contribute to the rank. To see more detailed information on rank calculations please visit Our Methods section in Explore Health Rankings at:countyhealthrankings.org.
How did the $7 \%$ benchmark for childcare affordability originate?
The Department of Health and Human Services published a 2016 update to rules and regulations for the Child Care and Development Fund (CCDF) program, which helps cover childcare costs for children from low-income households. The updated rules established a federal benchmark for an enrolled family's childcare co-payments not to be considered affordable if costs exceed $7 \%$ of household income. The benchmark has since been applied outside of the context of the CCDF program to indicate that low- and middle-income families should not spend more than $7 \%$ of their income on childcare for it to be considered affordable.
How does CHR\&R define county levels of urbanization?
We define levels of urbanization as: Rural (non-metropolitan counties with less than 50,000 people); Smaller Metro (counties within a metropolitan statistical area (MSA) with between 50,000 and 1 million people); Large Suburban Metro (non-central fringe counties within an MSA with more than 1 million people); Large Urban Metro (central urban core counties within an MSA with more than 1 million people).
How does CHR\&R define racial and ethnic groups?
We recognize that "race" or "ethnicity" are social categories. Society may identify individuals based on their physical appearance or perceived cultural ancestry, as a way of characterizing individuals' value. These categories are not based on biology or genetics. A strong and growing body of empirical research provides support for the fact that genetic factors are not responsible for racial differences in health factors and very rarely for health outcomes.

We are bound by data collection and categorization of race and ethnicity according to the U.S. Census Bureau definitions, in adherence with the 1997 Office of Management and Budget standards. Our analyses also do not capture those reporting more than one race, of "some other race", or who do not report their race. This categorization can mask variation within racial and ethnic groups and can hide historical context that underlies health differences.

## How does CHR\&R define gender?

We recognize that while the terms "gender" and "sex" are often used interchangeably, they do not represent the same concept. Sex is generally assigned at birth based on observed anatomy, while gender is a social construct wherein certain tendencies or behaviors are assigned by society to labels of masculine or feminine. We know that neither gender nor sex are binary constructs and that people living intersectional identities (e.g., transgender women) experience compounding power differentials, which are not captured in a binary delineation between men and women.

Ido not have a regular doctor/primary care doctor The emergency room was more convenient because location
The emergency room was more convenient because of cost
The emergency room was more convenient because of hours
At the time I thought it was a health-related emergency,
though I later learned it was NOT an emergency
My primary care doctor was not available due to COVID
COVID-19 Testing

[^0]:    Note: Town totals include Village totals
    *: The Village of Harriman population is included entirely within the Town of Monroe for this Table
    Note: Villages of South Blooming Grove and Woodbury were incorporated in 2006; Town of Palm Tree was incorporated in 2017 and made coterminous to the Village of Kiryas Joel thereafter. Prior to incorporation of Town of Palm Tree, the Village of Kiryas Joel was incorporated within the boundaries of the Town of Monroe.

[^1]:    2018-2019 data does not include Orange County births or deaths recorded in NYC All rates are calculated using ACS 5-year population estimates except for the age intervals <1 and 1-9, which are based off of crude live births in Orange County
